List of Tables

1 Scope

1.1 Identification

This document defines a set of services and interfaces as part of the Unmanned Maritime Autonomy Architecture (UMAA). The services and corresponding interfaces covered in this ICD encompass the functionality to provide situational awareness for an Unmanned Maritime Vehicle (UMV) (surface or undersea). As such, it provides services that focuses on providing decision-level information, which includes self (ownship) state information (such as navigation data and self-health); environmental information (both a-priori and sensed) such as map/chart data, bathymetry, currents, and weather; and world model data, including contact information and classification information (from single or multiple data-fused sources). This document is generated automatically from data models that define its services and interfaces as part of the Unmanned Systems (UxS) Control Segment (UCS) Architecture as extended by UMAA to provide autonomy services for unmanned vehicles.

To put each ICD in context of the UMAA Architecture Design Description (ADD), the UMAA functional decomposition mapping to UMAA ICDs is shown in Figure 1.
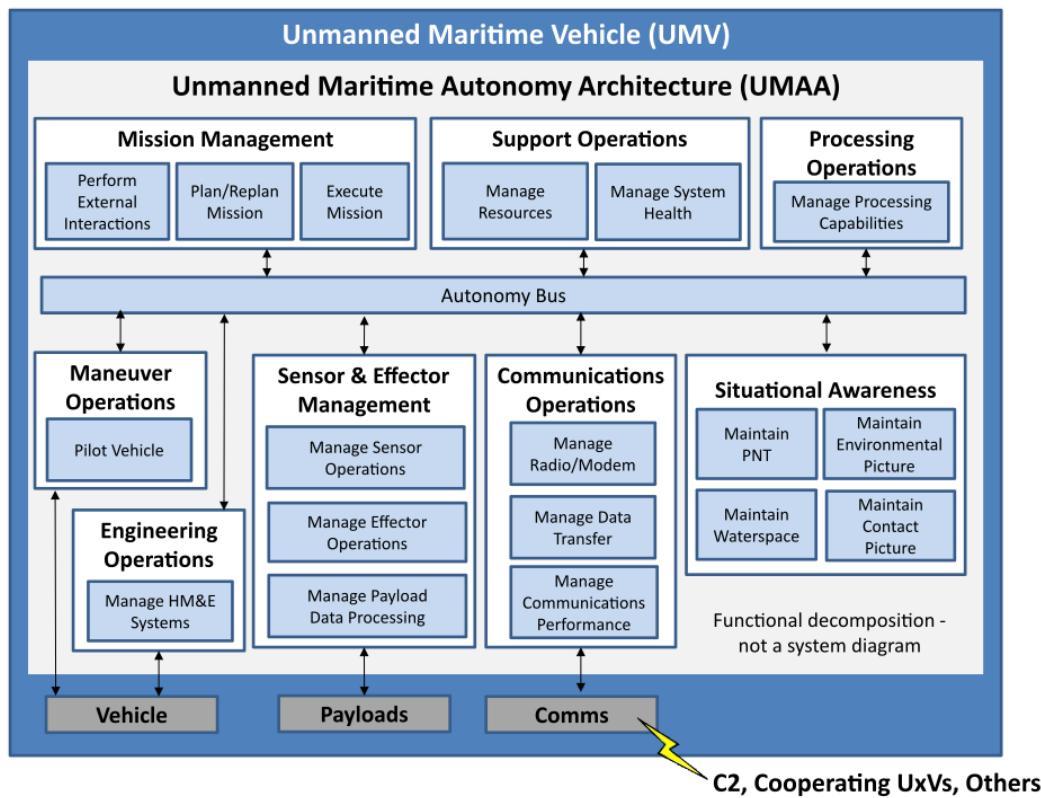

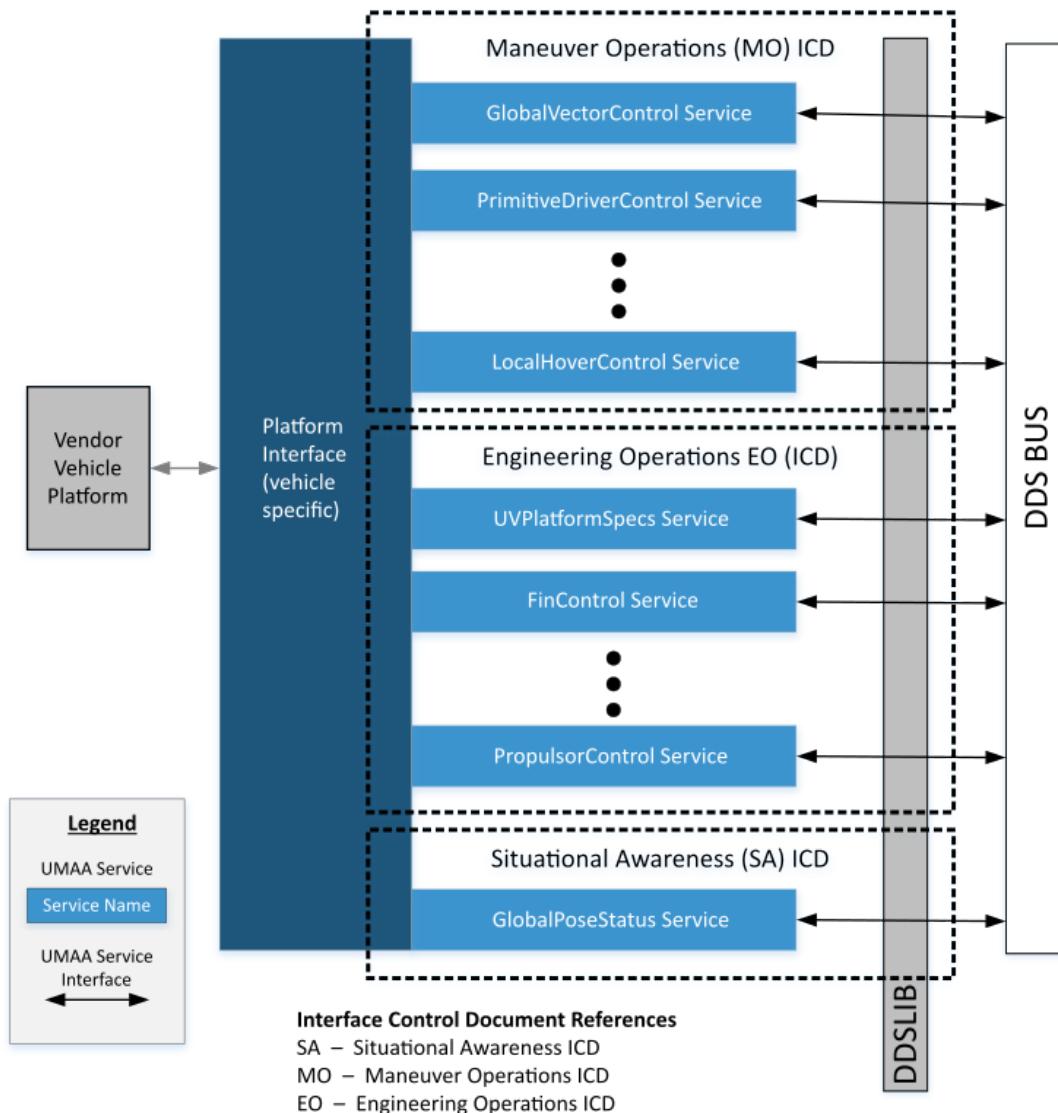

Figure 1: UMAA Functional Organization.

1.2 Overview

The fundamental purpose of UMAA is to promote the development of common, modular, and scalable software for unmanned vehicles that is independent of a particular autonomy implementation. Unmanned Maritime Systems (UMSs) consist of Command and Control (C2), one or more unmanned vehicles, and support equipment and software (e.g. recovery system, Post Mission Analysis applications). The scope of UMAA is focused on the autonomy that resides on-board the unmanned vehicle. This includes the autonomy for all classes of unmanned vehicles and must support varying levels of communication in mission (i.e., constant, intermittent, or none) with external systems. To enable modular development and upgrade of the functional capabilities of the on-board autonomy, UMAA defines eight high-level functions. These core functions include: Communications Operations, Engineering Operations, Maneuver Operations, Mission Management, Processing Operations, Sensor and Effector Operations, Situational Awareness, and Support Operations. In each of these areas, it is anticipated that new capabilities will be required to satisfy evolving Navy missions over time. UMAA seeks to define standard interfaces for these functions so that individual programs can leverage capabilities developed to these standard interfaces across programs

that meet the standard interface specifications. Individual programs may group services and interfaces into components in different ways to serve their particular vehicle's needs. However, the entire interface defined by UMAA will be required as defined in the ICDs for all services that are included in a component. This requirement is what enables autonomy software to be ported between heterogeneous UMAA-compliant vehicles with their disparate vendor-defined vehicle control interfaces without recoding to a vehicle-specific interface.

Situational Awareness includes the services and interfaces required to enable autonomous decision making by providing information gleaned from the sensing system (e.g. radar or sonar), from a-priori data (e.g. bathymetry), and from any externally provided data (contact data from a collaborating UMV). Situational Awareness (often also referred to as world model) also includes such things as data fusion from multiple data sources (e.g. visual and radar), inferencing of higher level knowledge from raw data (e.g. contact reported by a radar is a merchant), registration of different data sources to common spatial references (e.g. contact is 570 yards away on bearing 27 degrees relative to ownship and is at 34.5 degrees latitude and 76.3048 degrees longitude). Standardization of these services enables them to be used across platforms and across programs based on available sensing capabilities on each individual platform.

Figure 2: UMAA Services and Interfaces Example.

1.3   Document Organization

This interface control document is organized as follows:

Section 1 – Scope: A brief purview of this document

Section 2 – Referenced Documents: A listing of associated of government and non-government documents and standards

Section 3 – Introduction to Data Model, Services, and Interfaces: A description of the common data model across all services and interfaces

Section 4 – Introduction to Coordinate Reference Frames and Position Model: An overview of the reference frame model used by UMAA

Section 5 – Flow Control: A description of different flow control patterns used throughout UMAA

Section 6 – Situational Awareness (SA) Services and Interfaces: A description of specific services and interfaces for this ICD

2 Referenced Documents

The documents in the following table were used in the creation of the UMAA interface design documents. Not all references may be applicable to this particular document.

3   Introduction to Data Model, Services, and Interfaces

3.1   Data Model
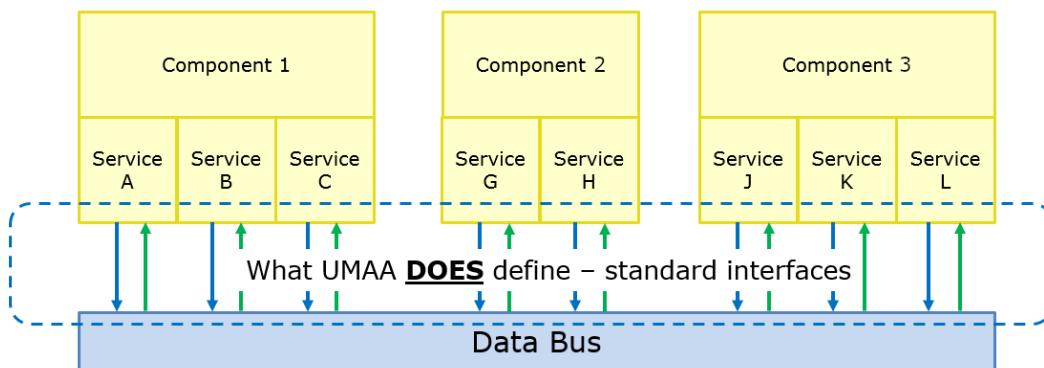

A common data model is at the heart of UMAA. The common data model describes the entities that represent system state data, the attributes of those entities and relationships between those entities. This is a "data at rest" view of system-level information. It also contains data classes that define types of messages that will be produced by components, or a "data in motion" view of system-level information.

The common data model and coordinated service interfaces are described in a Unified Modeling Language (UML$^{\text{TM}}$) modeling tool and are represented as UML$^{\text{TM}}$ class diagrams. Interface definition source code for messages/topics and other interface definition products and documentation will be automatically generated from the common data model so that they are consistent with the data model and to ensure that delivered software matches its interface specification.

The data model is maintained as a Multi-Domain Extension (MDE) to the UCS Architecture and will be maintained under configuration control by the UMAA Board as UCSMDE and will be incrementally integrated into the core UCS standard. Section 6 content is automatically generated from this data model, as are other automated products such as IDL that are used for automated code generation.

3.2   Definitions

UMAA ICDs follow the UCS terminology definitions found in the UCS Architecture Description v2.4. The normative (required) implementation to satisfy the requirements of a UMAA ICD is to provide service and interface specification compliance. Components may group services and required interfaces in any manner so long as every service meets its interface specifications. Figure 3 shows a particular grouping of services into components. The interfaces are represented by the blue and green lines and may equate to one or more independent input and output interfaces for each service. The implementation of the service into software components is left up to the individual system development. Given this context, section 6 correspondingly defines services with their interfaces and not components.

Figure 3: Services and Interfaces Exposed on the UMAA Data Bus.

Services may use other services within this ICD, or in other UMAA defined ICDs, to provide their capability. Additionally, components for acquisition and development may span multiple ICDs. An example of this would be a commercial radar that provides both status and control of the unit via the radar's software Application Programming Interface (API).

3.3   Data Distribution Service (DDS$^{\text{TM}}$)

The data bus supporting autonomy messaging (as seen in Figure 3) is implemented via DDS$^{\text{TM}}$. DDS is a middleware protocol and API standard for data-centric connectivity from the Object Management Group (OMG). It integrates the components of a system together, providing low-latency data connectivity, extreme reliability, and a scalable architecture. In a distributed system, middleware is the software layer that lies between the operating system and applications. It enables the various system components to more easily communicate and share data. It simplifies the development of distributed systems by letting software developers focus on the specific purpose of their applications rather than the mechanics of passing information between applications and systems. The DDS specification is fully described in free reference material on the OMG website and there are both open source and commercially available implementations.

3.4 Naming Conventions

UMAA services are modeled within the UCS Architecture under the Multi-Domain Extension (MDE). The UCS Architecture uses SoaML concepts of participant, serviceInterface, service port, and request port to describe the interfaces that make up a service and show how the service is used. Each service defines the capability it provides as well as required interfaces. Each interface consists of an operation that accepts a single message (A SoaML MessageType). In SoaML, a MessageType is defined as a unit of information exchanged between participant Request and Service ports via ServiceInterfaces. Instances of a MessageType are passed as parameters in ServiceInterface operations. (Reference: UCS Architecture, Architecture Technical Governance)

To promote commonality across service definitions, a common way of naming services and their sets of operations and messages has been adopted for defining services within UCS-MDE. The convention uses the Service Base Name <SBN> and an optional Function Name [FN] to derive all service names and their associated operations and messages. As this is meant to be a guide, services might not include all of the defined operations and messages and their names might not follow the convention where a more appropriate name adds clarity.

Furthermore, services in UMAA are not required to be defined as indicated in Table 3 when all parts of the service capabilities are required for the service to be meaningful (such as ResourceAllocation).

Additionally, note that for UMAA not all operations defined in UCS-MDE result in a message being published to the DDS bus, e.g., since DDS uses publish/subscribe, most query operations result in a subscription to a topic and do not actually publish the associated request message. In the case of cancel commands, there is no associated implementation of the cancel<SBN>[FN]CommandStatus as it is just the intrinsic response of the DDS dispose function; so, it is essentially a NOOP (no operation) in implementation. The conventions used to define UCS-MDE services are as follows:

Service Name
    <SBN>[FN]Config
    <SBN>[FN]Control
    <SBN>[FN]Specs
    <SBN>[FN]Status OR Report

where the SBN should be descriptive of the task or information provided by the service. Note that the FN is optional and only included if needed to clarify the function of the service. The suffixes Status and Report are interchangeable. If a "Report" is a more appropriate description of the service, it can be used in lieu of "Status".

Table 3: Service Requests and Associated Responses

	Service Requests (Inputs)	**Service Responses (Outputs)**
Config	set<SBN>[FN]Config	report<SBN>[FN]ConfigCommandStatus
	query<SBN>[FN]ConfigAck	report<SBN>[FN]ConfigAck
	query<SBN>[FN]Config	report<SBN>[FN]Config
	cancel<SBN>[FN]Config	report<SBN>[FN]CancelConfigCommandStatus
	query<SBN>[FN]ConfigExecutionStatus	report<SBN>[FN]ConfigExecutionStatus
Control	set<SBN>[FN]	report<SBN>[FN]CommandStatus
	query<SBN>[FN]CommandAck	report<SBN>[FN]CommandAck
	cancel<SBN>[FN]Command	report<SBN>[FN]CancelCommandStatus

report<SBN>[FN]:<SBN>[FN]ReportType

where,

- Config (Configuration) Command/Report – This is the setup of a resource for operation of a particular task. Attributes may be static or variable. Examples include: maximum RPM allowed, operational sonar frequency range allowed, and maximum allowable radio transmit power.

- Command Status – This is the current state of a particular command (either control or configuration).

- Command – This is the ability to influence or direct the behavior of a resource during operation of a particular task. Attributes are variable. Examples include a vehicle's speed, engine RPM, antenna raising/lowering, and controlling a light or gong.

- Command Ack (Acknowledgement) Report – This is the command currently being executed.

- Cancel – This is the ability to cancel a particular command that has been issued.

- Execution Status Report – This is the status related to executing a particular command. Examples associated with a waypoint command include cross track error, time to achieve, and distance remaining.

- Specs (Specifications) Report – Provides a detailed description of a resource and/or its capabilities and constraints. Attributes are static. Examples include: maximum RPM of a motor, minimum frequency of a passive sonar sensor, length of the unmanned vehicle, and cycle time of a radar.

- Report – This is the current information being provided by a resource. Examples include vehicle speed, rudder angle, current waypoint, and contact bearing.

3.5   Namespace Conventions

Each UMAA service and the messages under the service can be accessed through their appropriate UMAA namespace. The namespace reflects the mapping of a specific service to its parent ICD, and the parent ICD's mapping to the overall UMAA Design Description. For example:

Access the Primitive Driver Control service under Maneuver Operations:

---

[1]These message types are required for UCS model rules of construction, but are not implemented as messages in the UMAA specification.
[2]At this time, there are no Requests in the specification. This will be the message format when Requests have been added.

    UMAA::MO::PrimitiveDriverControl
Access the ContactReport Service under Situational Awareness:
    UMAA::SA::ContactReport

The UMAA model uses common data types that are re-used through the model to define service interface topics, interface topics, and other common data topics. These data types are not intended to be directly utilized but, for reference, they can be accessed in the same manner:

Access the common UMAA Status Message Fields:
    UMAA::UMAAStatus
Access the common UMAA GeoPosition2D (i.e., latitude and longitude) structure:
    UMAA::Common::Measurement::GeoPosition2D

3.6   Cybersecurity

The UMAA standard addressed in this ICD is independent from defining specific measures to achieve Cybersecurity compliance. This UMAA ICD does not preclude the incorporation of security measures, nor does it imply or guarantee any level of Cybersecurity within a system. Cybersecurity compliance will be performed on a program-specific basis and compliance testing is outside the scope of UMAA.

3.7   GUID algorithm

The UMAA standard utilizes the Globally Unique IDentifier (GUID), conforming to the variant defined in RFC 4122 (variant value of 2). Generators of GUIDs may generate GUIDs of any valid, RFC 4122-defined version that is appropriate for their specific use case and requirements. (Reference: A Universally Unique IDentifier (UUID) URN Namespace)

3.8   Large Collections

The UMAA standard defines Large Collections, which are collections of decoupled but related data. Large Collections provide the ability to update one or more elements of the collection without republishing the entire collection to the DDS bus. This avoids two problems related to using an unbounded sequence type in a DDS message: 1) resource consumption growing as the collection is appended to or updated, and 2) DDS implementation-specific limitations on unbounded sequences. There are two implementations of a Large Collection: the Large Set (unordered) and the Large List (ordered).

In both Large Collection implementations, there are two important abstractions: the collection metadata and collection element type. Because Large Collections are specific to the UMAA PSM, the type definitions for the collection metadata and collection element are not part of MDE, and the IDL definitions of these types are generated separately. A particular UMAA message that has a Large Collection attribute will reference the metadata type (LargeSetMetadata or LargeListMetadata). The collection element type is defined under the same namespace as the message that uses it, and follows the naming pattern <parent message name><attribute name><collection type>Element. Each element of the collection is published as a separate message on the DDS bus, and can be tracked back to their related collection using the setID or listID. Users can also trace an element in a set to the source attribute (a NumericGUID) of the Service Provider that generated the report with this set using the collection metadata.

3.8.1   Necessary QoS
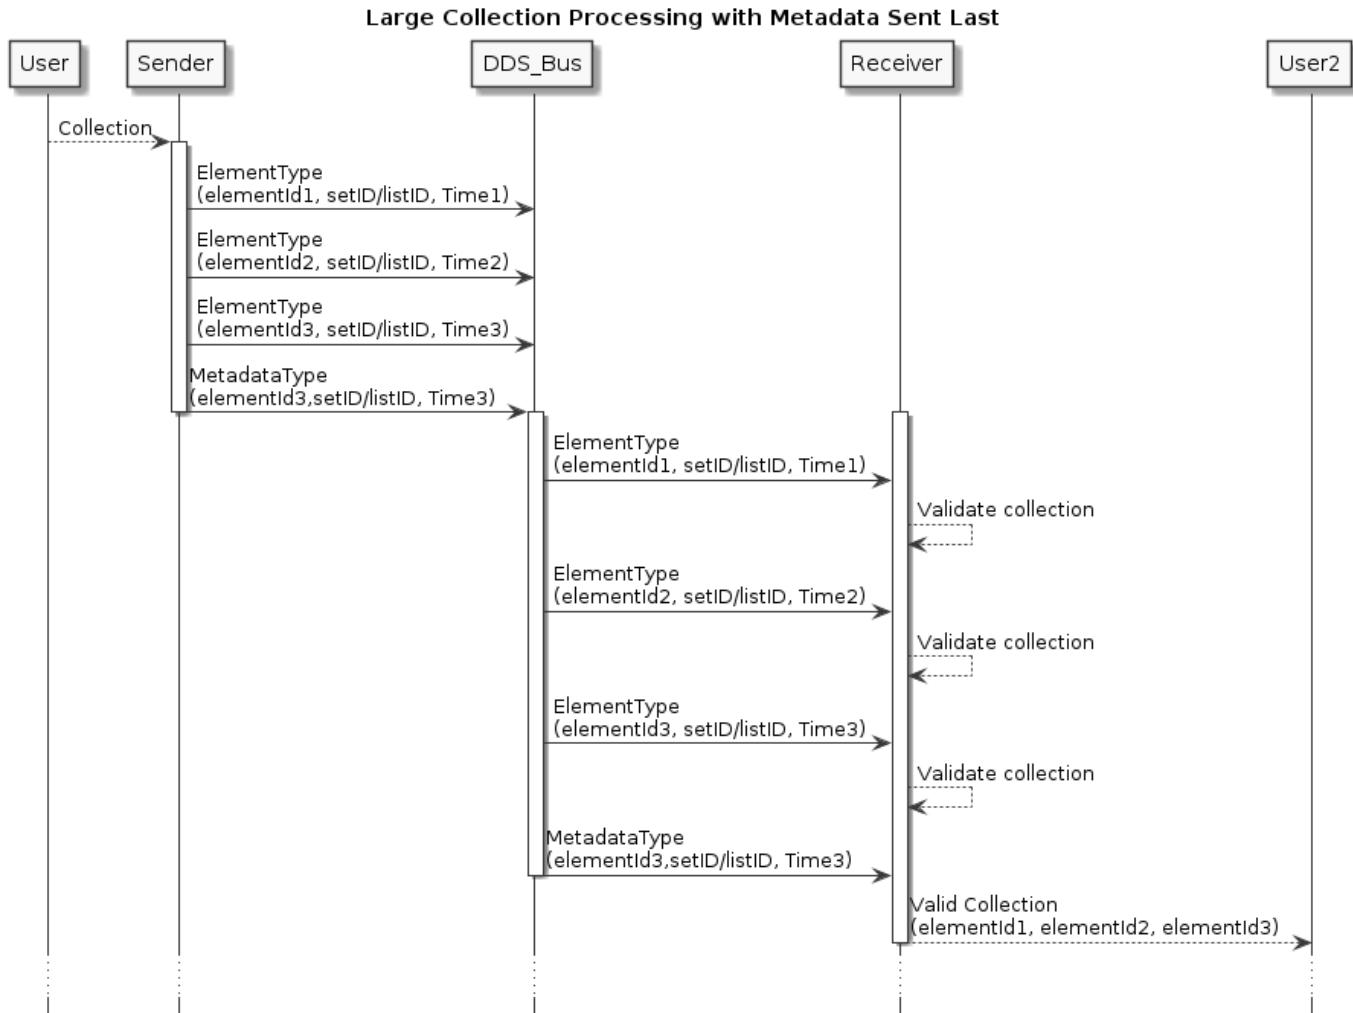

To achieve the Large Collection consistency in the update process described below, ordering of samples on the collection element type topic is necessary. Therefore, publishers and subscribers to the collection element type topic must use the `PRESENTATION` QoS policy with an `access_scope` of `DDS_TOPIC_PRESENTATION_QOS` and `ordered_access`.

Note that Large Collection Metadata and Elements are sent on separate DDS topics. DDS QoS does not guarantee ordering across topics. For this reason, implementations must be able to handle cases where elements arrive before or after the associated metadata. Memory must be allocated to await the proper metadata and associated elements.

3.8.2   Creating Large Collections
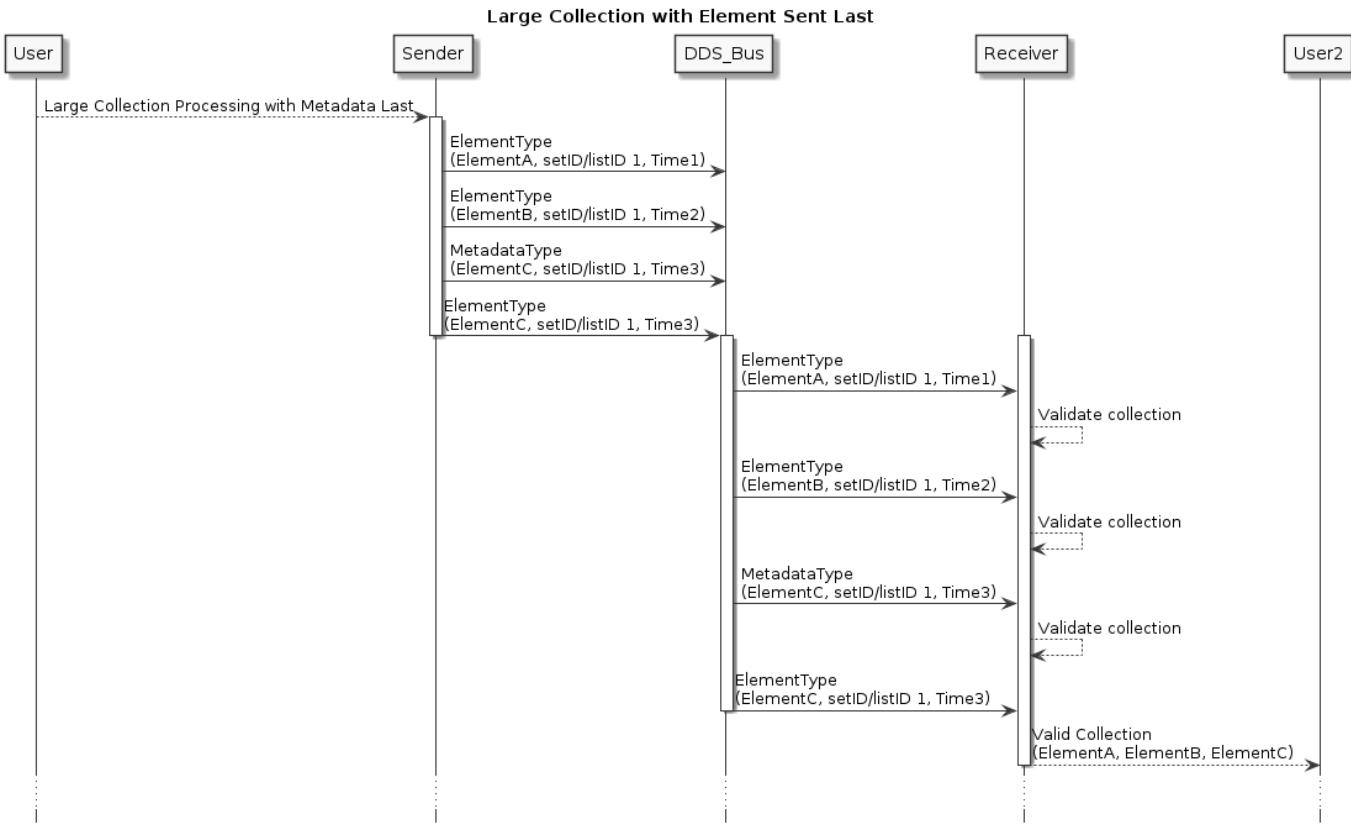

To create a large collection, a series of element messages and a metadata message must be sent from one DDS participant (the sender) to another (the receiver). The messages should be buffered on the receiving side until a synchronization point is

reached which indicates an atomic update. That is, when both a metadata message and an element message corresponding by list ID, timestamp, and last element ID have been received, yield a complete collection. Figure 4 shows the sequence of exchanges to establish a collection with 3 elements.

Figure 4: Sequence Diagram for initialization of a Large Collection with 3 elements.

The same collection could be established where the element data arrives after the metadata, creating the same list as depicted in figure 5.
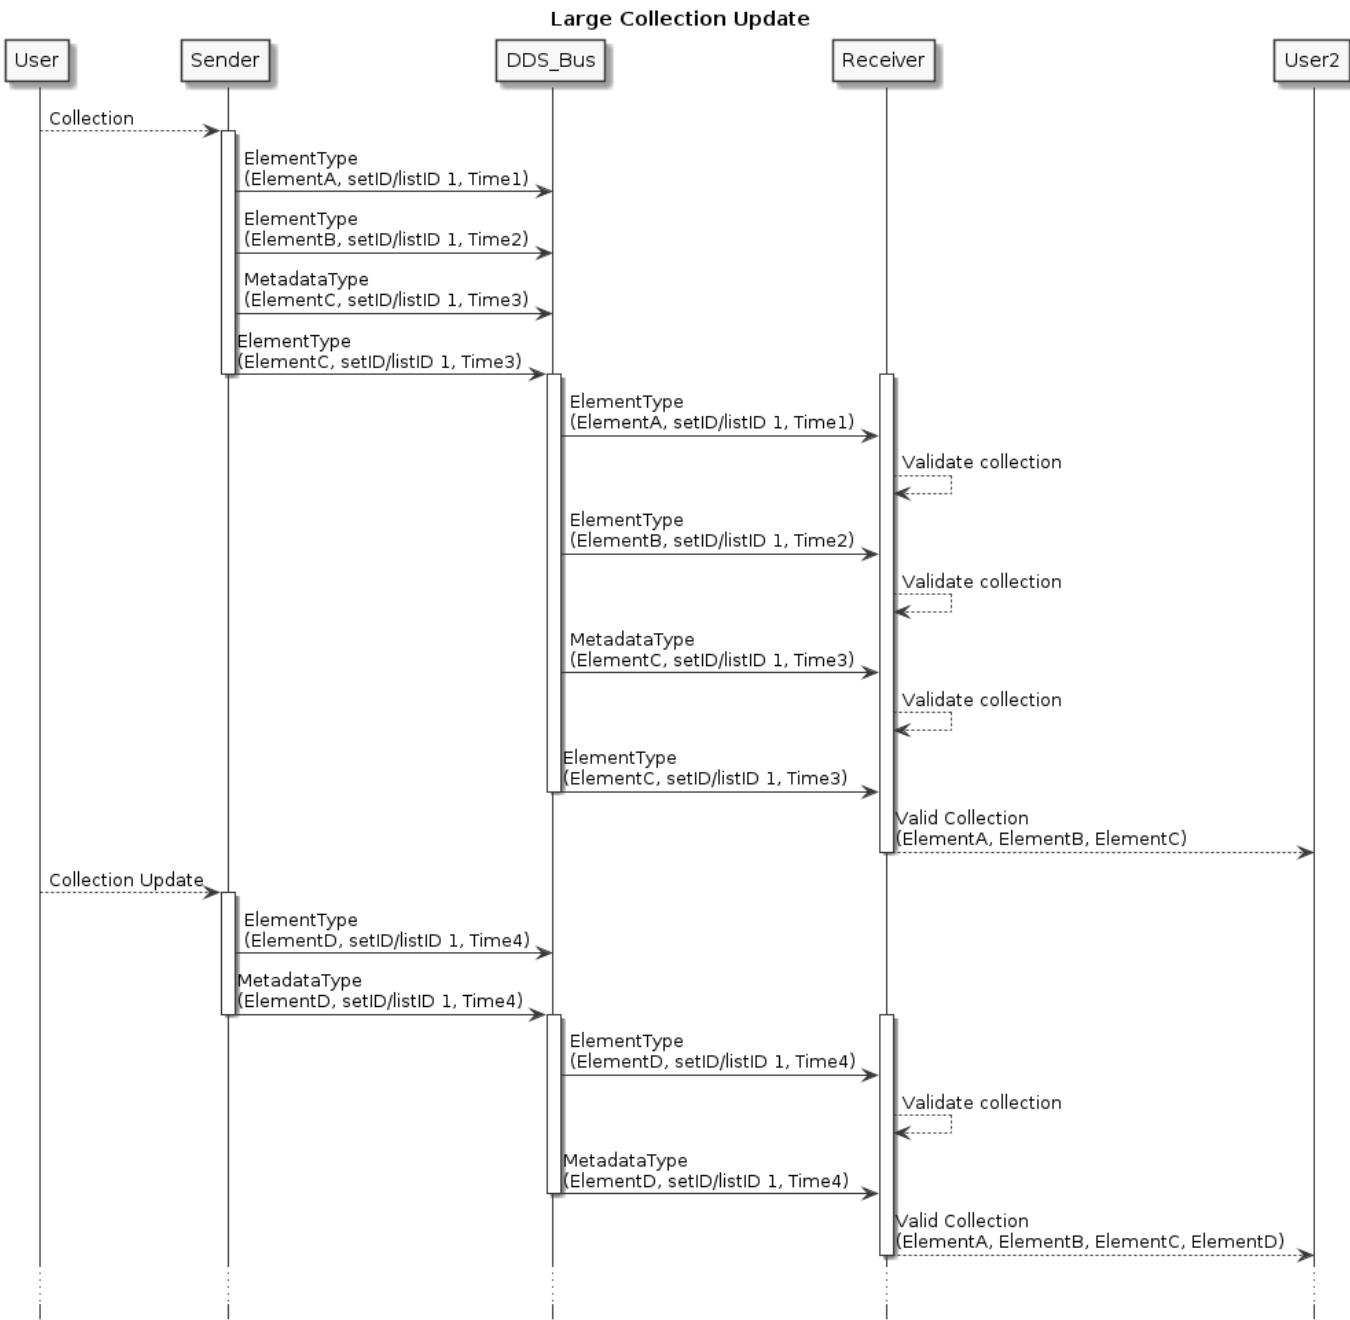

Figure 5: Sequence Diagram for initialization of a Large Collection with 3 elements.

3.8.3   Updating Large Collections

When elements of the collection are updated, the metadata must be updated as well to signal a change in the set. The `updateElementID` is updated to match the elementID of the element whose reception signals the end of the atomic update of the collection. Because of the requirement of an ordered topic described above, this will be the element that is updated last chronologically. The metadata `updateElementTimestamp` must be updated to the timestamp of the same element that signals the end of the update.
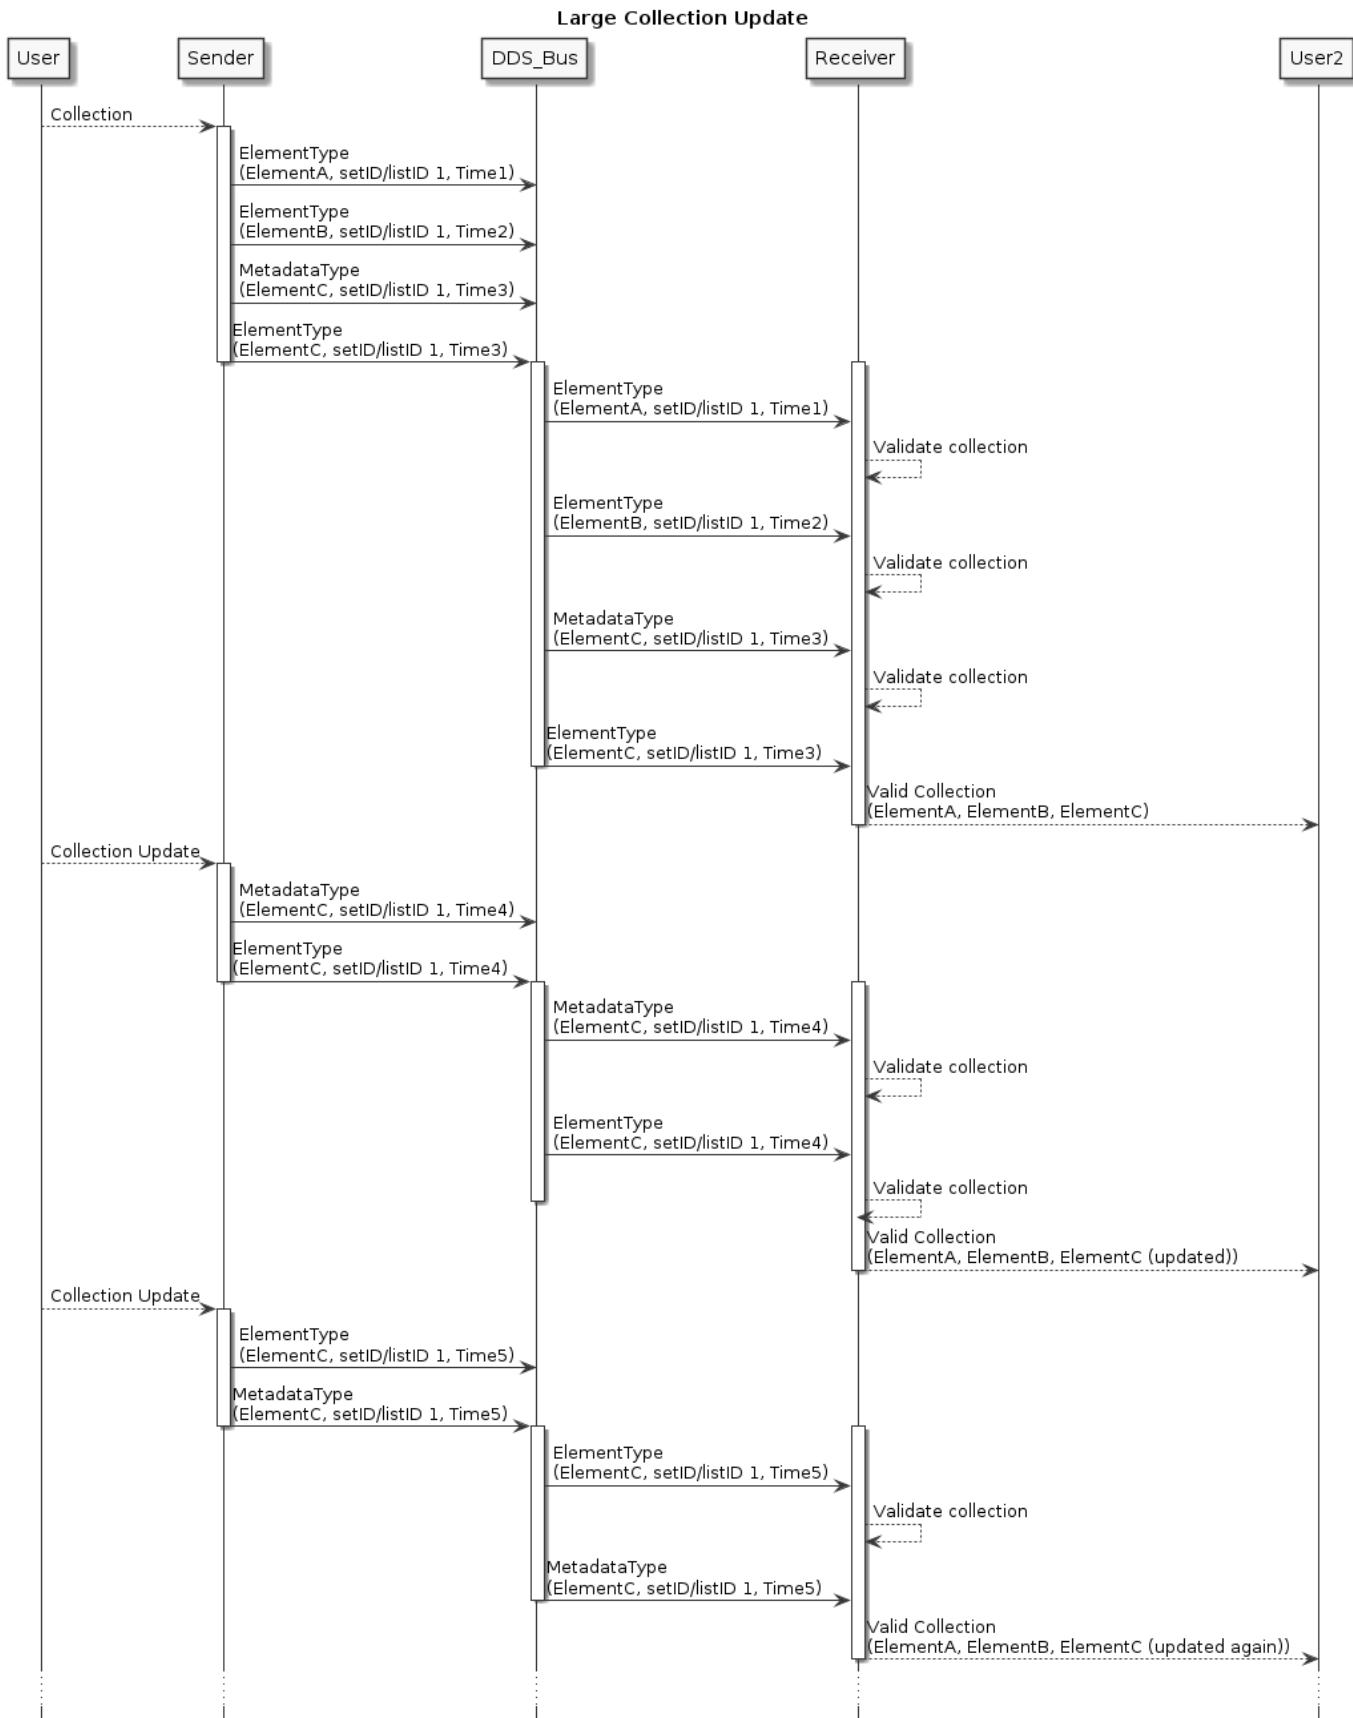

The set can be updated as a batch (multiple elements in a single "update cycle," as determined by the provider). This allows for a coarse synchronization: data elements that do not match the metadata `updateElementID` and `updateElementTimestamp` can be assumed to be part of an in-progress update cycle. Consumers can choose to immediately act on those data individually or wait until the matching element is received to signal that the complete update cycle has finished and consider the set as a whole. Note that the coarseness of synchronization is service-dependent: in some cases an intermediate view of a collection update may be logically incorrect to act upon.

Figure 6 shows the sequence of exchanges to update a collection of 3 elements and add a 4th element.

Figure 6: Sequence Diagram for update of Large Collection.

Figure 7 shows the sequence of exchanges to update an element of a collection multiple times.

Large Collection Update
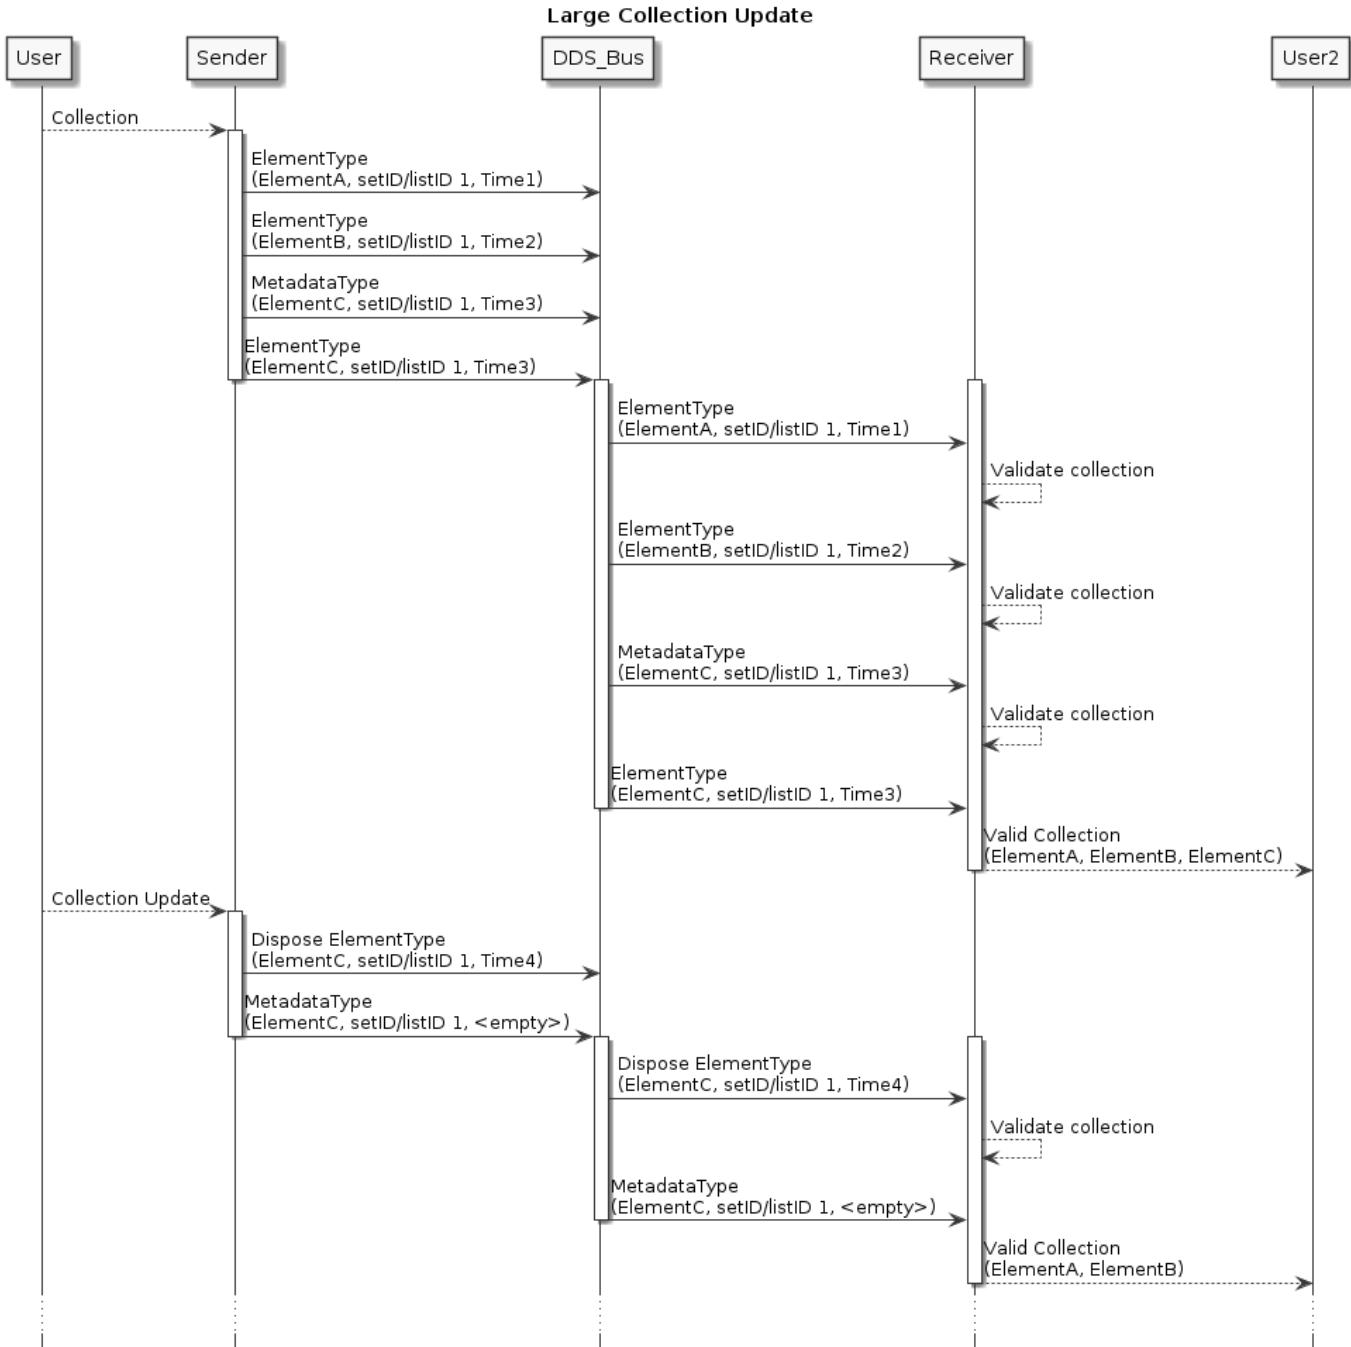

Figure 7: Sequence Diagram for update of an element of a Large Collection multiple times.

3.8.4   Removing an element from Large Collections

To remove an element from a collection, dispose of the element on the element topic and re-publish the metadata. Multiple deletes and inserts can happen for a single metadata update. In the case where the final element of the collection is deleted, the updateElementTimestamp should be unset in the metadata.

Figure 8 shows the sequence of exchanges to delete an element from a Large Collection.
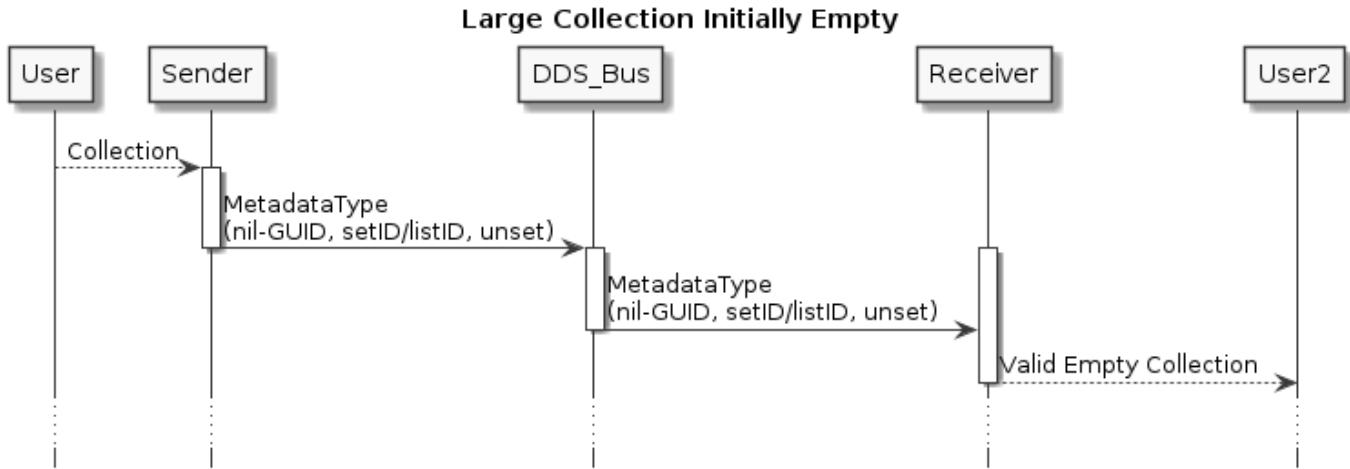

Figure 8: Sequence Diagram for delete of element from Large Collection.

For Large Lists, it may be necessary to update the nextElementID references during delete operations to ensure that the list is still valid. This would cause multiple element messages to be sent along with updated metadata.

3.8.5 Specifying an Empty Large Collection

A particular Large Collection can be empty during initial creation. This is indicated by publishing metadata with a `size` of zero and an `updateElementID` set to the Nil UUID. As specified in section 4.1.7 of the referenced document "A Universally Unique IDentifier (UUID) URN Namespace", this is a "special form of UUID that is specified to have all 128 bits set to zero".

Figure 9 shows the sequence of exchanges to establish an initially empty Large Collection.

Figure 9: Sequence Diagram for initialization of an empty Large Collection.

3.8.6 Large Set Types

The following details the LargeSetMetadata structure:

Table 4: LargeSetMetadata Structure Definition

Attribute Name	Attribute Type	Attribute Description
setID	NumericGUID	Identifies the Large Set instance this metadata relates to.
updateElementID	NumericGUID	This field references the element ID of the set element whose reception signals the end of an atomic update to this set. This elementID must be used in conjunction with the updateElementTimestamp below to fully identify when the atomic update has completed and the set is stable.
updateElementTimestamp†	DateTime	This field identifies the elementTimestamp of the element, referenced above by updateElementID, that signals the end of an atomic update to this set. This field will be empty in the event that the element update results from a DDS dispose.
size	LargeCollectionSize	Indicates the number of elements associated with this set after the atomic update is complete.

An example element type is shown below, where a `FooReportType` message has a Large Set attribute called "items" whose type is `BarType`

Table 5: Example FooReportTypeItemsSetElement Structure Definition

Attribute Name	Attribute Type	Attribute Description
element	BarType	The value of the set element.
setID*	NumericGUID	Identifies the Large Set instance this element relates to.
elementID*	NumericGUID	Uniquely identifies this element within the set and across all large collection elements that currently exist on the DDS bus.
elementTimestamp	DateTime	The timestamp of this element.

3.8.7   Large List Types

The following details the LargeListMetadata structure:

Table 6: LargeListMetadata Structure Definition

Attribute Name	Attribute Type	Attribute Description
listID	NumericGUID	Identifies the Large List instance this metadata relates to.
updateElementID	NumericGUID	This field references the element ID of the list element whose reception signals the end of an atomic update to this list. This elementID must be used in conjunction with the updateElementTimestamp below to fully identify when the atomic update has completed and the list is stable.
updateElementTimestamp†	DateTime	This field identifies the elementTimestamp of the element, referenced above by updateElementID, that signals the end of an atomic update to this list. This field will be empty in the event that the element update results from a DDS dispose.
startingElementID	NumericGUID	This field identifies the list element, tying to its elementID, that is sequentially first in the list. This is provided for convenience when iterating through the linked list using the nextElementID field.
size	LargeCollectionSize	Indicates the number of elements associated with this set after the atomic update is complete.

An example element type is shown below, where a `FooReportType` message has a Large List attribute called "items" whose type is `BarType`
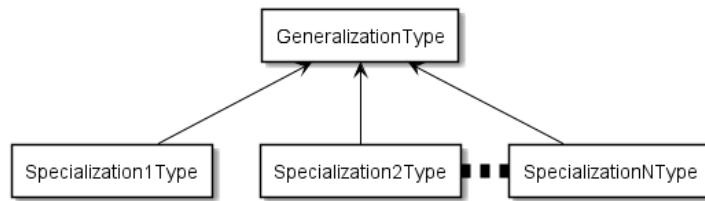

Table 7: Example FooReportTypeItemsListElement Structure Definition

Attribute Name	Attribute Type	Attribute Description
element	BarType	The value of the list element.
listID*	NumericGUID	Identifies the Large List instance this element relates to.
elementID*	NumericGUID	Uniquely identifies this element within the list and across all large collection elements that currently exist on the DDS bus.
elementTimestamp	DateTime	The timestamp of this element.

Attribute Name	Attribute Type	Attribute Description
nextElementID†	NumericGUID	This field references to the elementID of the element that logically follows this element in the linked list. This is empty if this element is sequentially last.

3.9 Generalizations and Specializations

The UMAA standard makes use of generalization/specialization relationships when defining data types. The generalization/specialization relationship is one where a generalization data structure is defined to contain attributes that are common across some entity and specialization data structures are defined to contain attributes that are specific to a particular type of that entity. This relationship can be modeled as inheritance in UML as shown below.
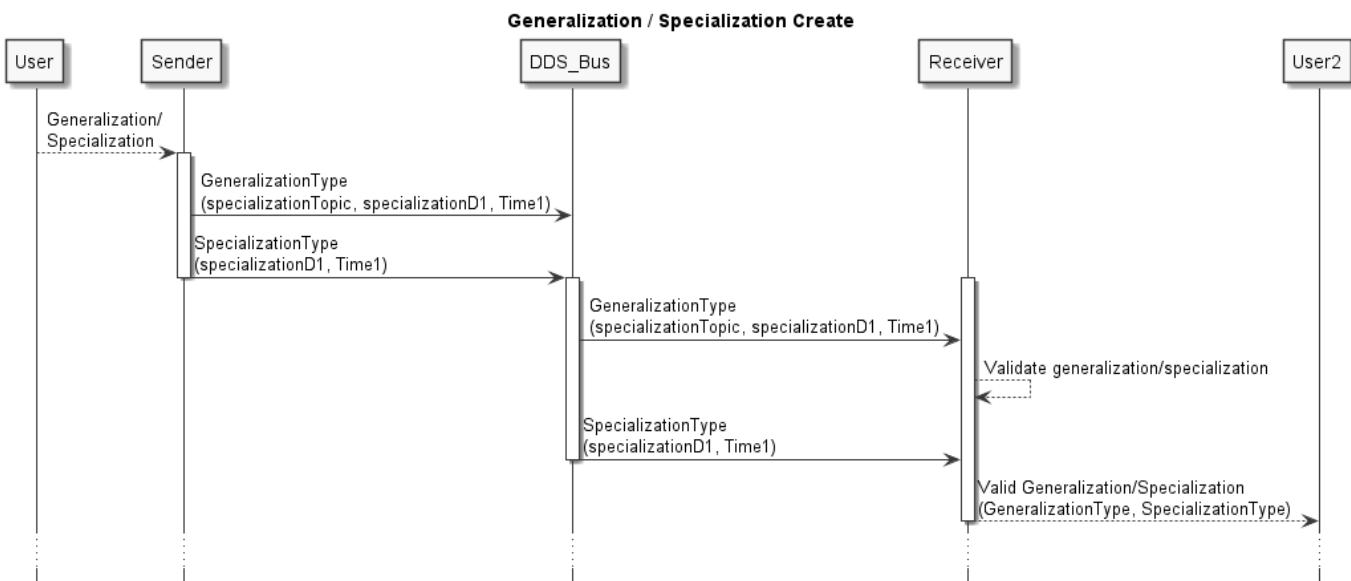

Figure 10: Generalization/Specialization UML diagram.

When the data type of an attribute within a message is a generalization, it is defined to be that generalization plus the data type of one of its specializations. In order to support this relationship, the generalization data structure and its specialization data structure are published to separate topics along with additional metadata linking the two topics. Specifically, the generalization data structure includes: specializationTopic, specializationID, and specializationTimestamp; and the specialization data structure includes: specializationID and specializationTimestamp. The specializationTopic specifies the topic name of the particular specialization, and the specializationID and specializationTimestamp must be equivalent in each topic, respectively, in order to establish the generalization/specialization relationship.

3.9.1 Creating a generalization/specialization
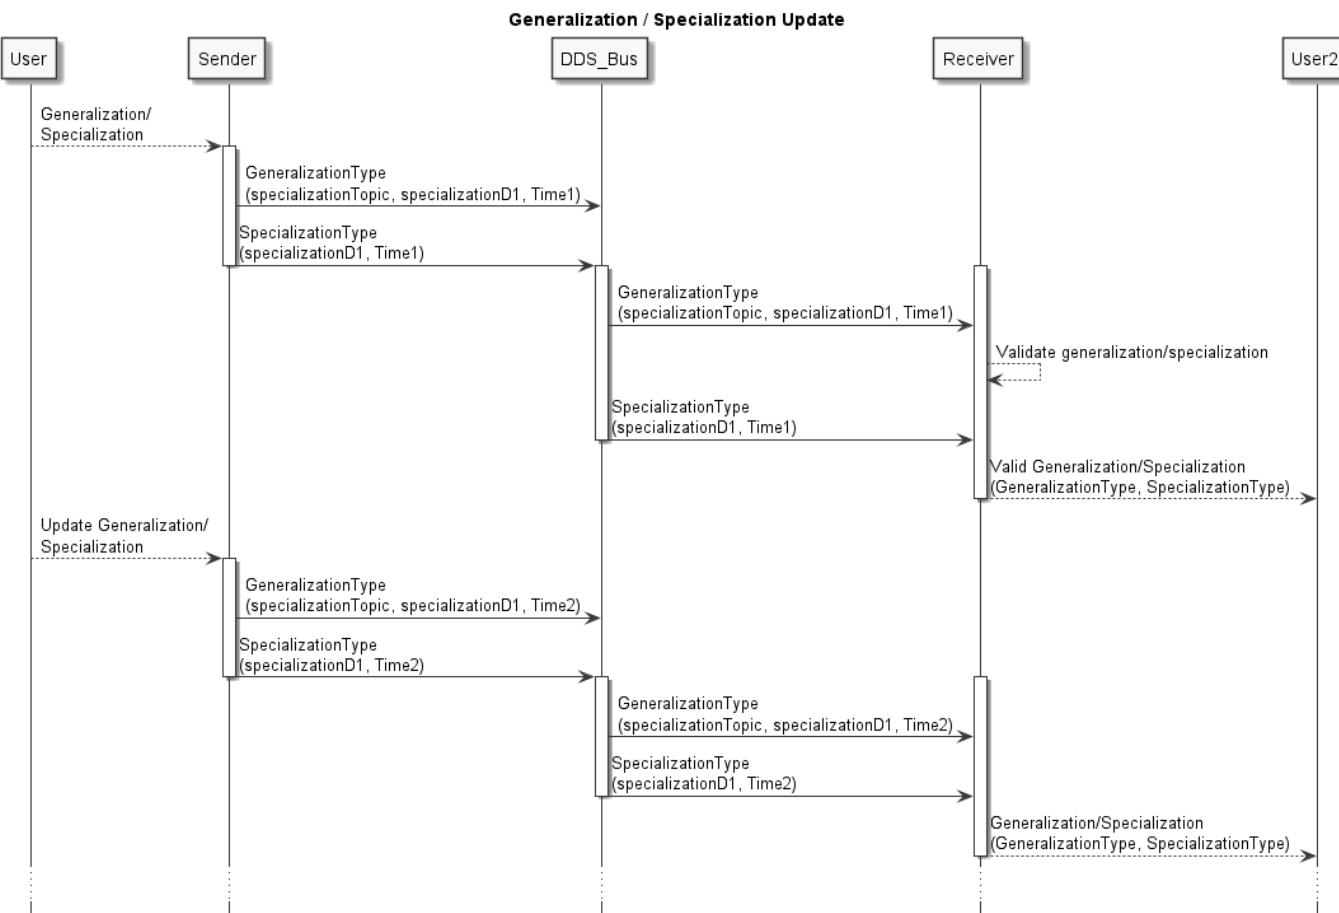

To create a generalization/specialization, both the GeneralizationType and SpecializationType topics must be sent from one DDS participant (the sender) to another (the receiver). The topics should be buffered on the receiving side until a synchronization point is reached that indicates an atomic update.

Figure 11: Sequence diagram for creating a generalization/specialization.

3.9.2   Updating a generalization/specialization
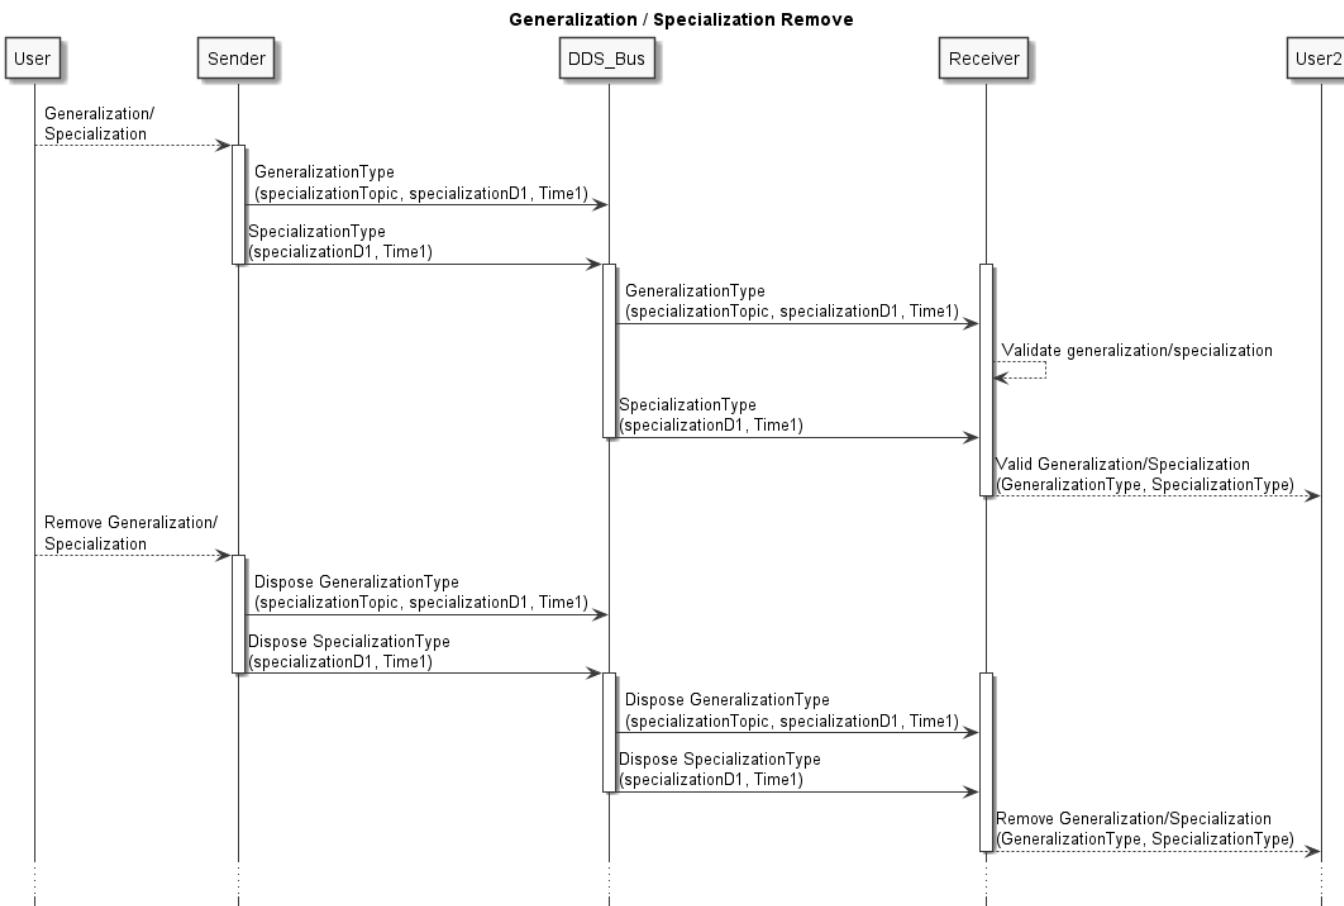

An update to a generalization/specialization can occur when there is a change in either data structure. In order for the update to be complete, the specializationTimestamp must be updated in both the GeneralizationType and the SpecializationType, and again they must be equal. Note that if a generalization/specialization exists within a large set or large list that their respective metadata must also be updated as defined in Section 3.8.

Figure 12: Sequence diagram for updating a generalization/specialization.

3.9.3   Removing a generalization/specialization

To remove a generalization/specialization, both topics must be disposed. Again, note that if a generalization/specialization exists within a large set or large list that their respective metadata must also be updated as defined in Section 3.8.

4   Introduction to Coordinate Reference Frames and Position Model

4.1   Platform Reference Frame

In the following Service Definitions, we use the parameters yaw, pitch, and roll to define the platform orientation with respect to the specified reference frame. Each parameter is described as a rotation around a given axis: Yaw about the Z axis. Pitch about the Y axis. Roll about the X axis. A UUV is shown in the diagrams because it has more degrees for freedom for its pose and motion, however, the terminology equally applies to both USVs and UUVs.

The axes are defined as:

- X - Positive in the forward direction, negative in the aft.

- Y - Positive in the starboard direction, negative in the port.

- Z - Positive in the down direction, negative in the up.
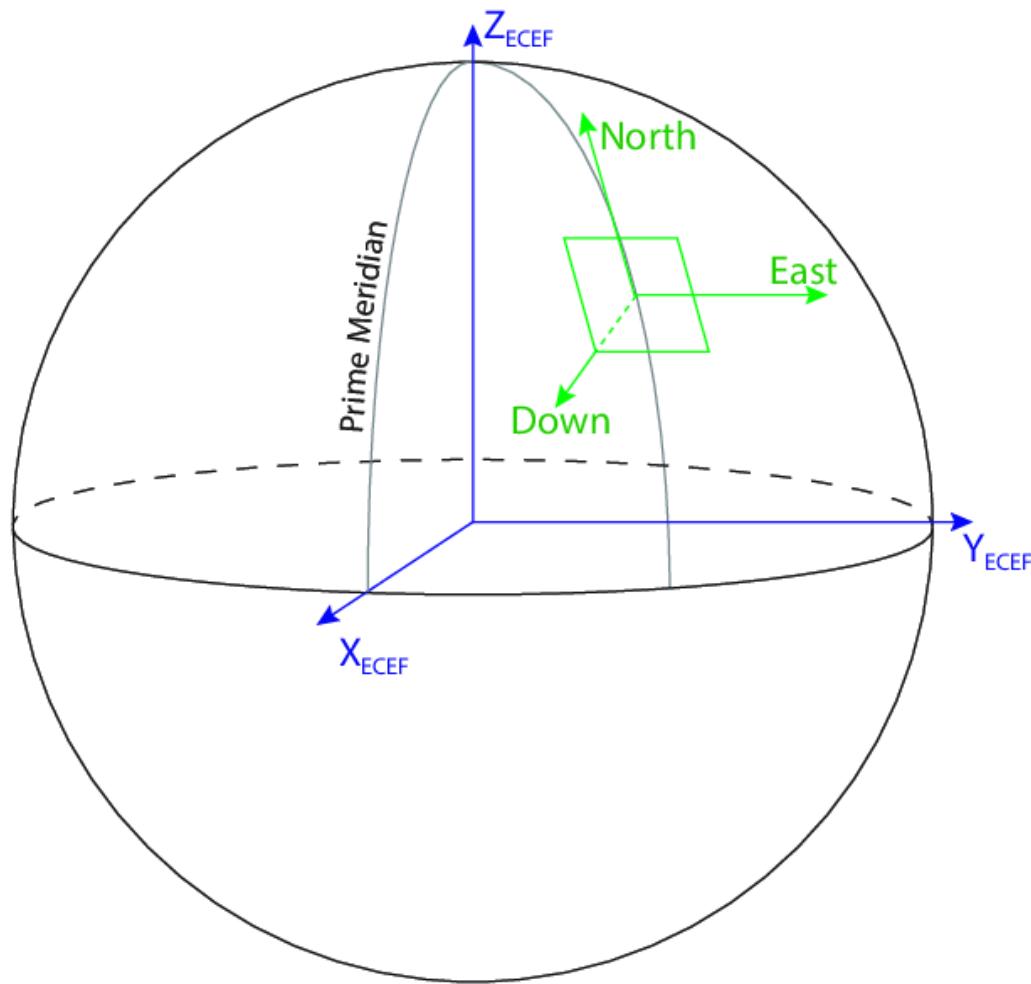

Additionally, rotations about all axes follow the right-hand rule.

4.2   Earth-Centered Earth-Fixed Frame

The Earth-Centered Earth-Fixed (ECEF) frame is a global reference frame with its origin at the center of the ellipsoid modeling the Earth's surface (Figure 14). The Z-axis points along the Earth's axis of rotation through the North Pole. The X-axis points from the origin to the intersection of the equator with the prime meridian, which defines 0° longitude. The Y-axis completes the right-handed orthogonal system, intersecting the equator at the 90° east meridian.

4.3   North-East-Down Frame

The North-East-Down (NED) frame is defined with an origin at the object described by the navigation solution. The Down axis is defined as normal to the surface of the reference ellipsoid in the direction pointing towards the interior of the Earth. The North axis is the projection of the line from the object to the north pole onto the plane orthogonal to the Down axis. The East axis completes the right-handed orthogonal system and points in the East direction.

Figure 14: Origins and axes of the Earth-Centered Earth-Fixed (ECEF) and North-East-Down (NED) frames.

4.4   WGS 84

The World Geodetic System (WGS) 1984 defines a standard coordinate system for the Earth. It represents the Earth as an oblate spheroid, and defines the mapping between latitude-longitude-altitude (LLA) coordinates and Cartesian ECEF coordinates. GPS reports positions in WGS 84 LLA coordinates. It has become the standard datum for navigation.
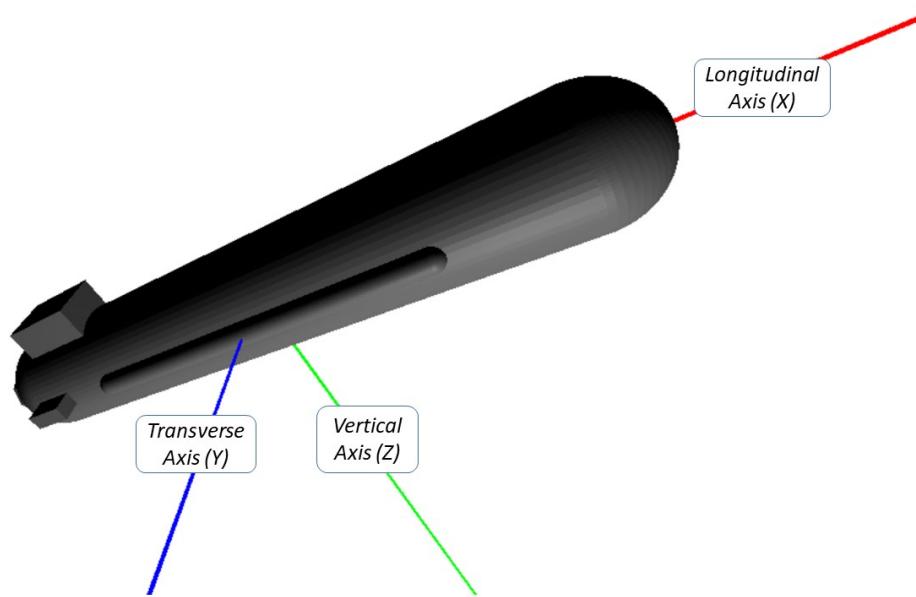

While the UMAA services typically make use of the coordinate systems defined by WGS 84, it also defines an Earth Gravity Model (EGM) and a World Magnetic Model (WMM) which are updated regularly.

4.5   Vehicle Orientation
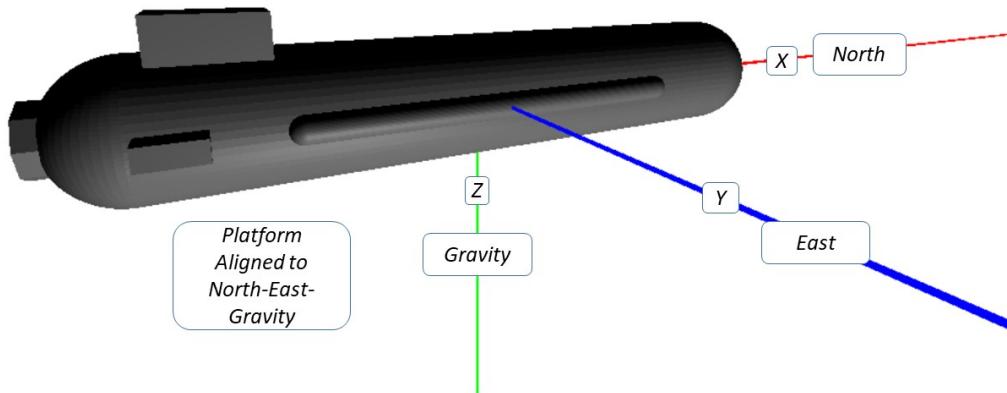

Determining the orientation of the vehicle (Figure 15) with respect to any reference frame is carried out via the following procedure (Figure 16).

1. Align the vehicle's longitudinal or X axis with the reference frame X axis. In the global reference frame, this is the north direction.

2. Align the vehicle's down or Z axis with the reference frame's Z axis. In the global reference frame, this is the gravity direction.

3. Ensure that the vehicle's transverse or Y axis is aligned with the reference frame's Y axis. In the global reference frame, this is the east direction.

4. Rotate the vehicle about the vehicle's Z axis by the yaw angle (Figure 17).
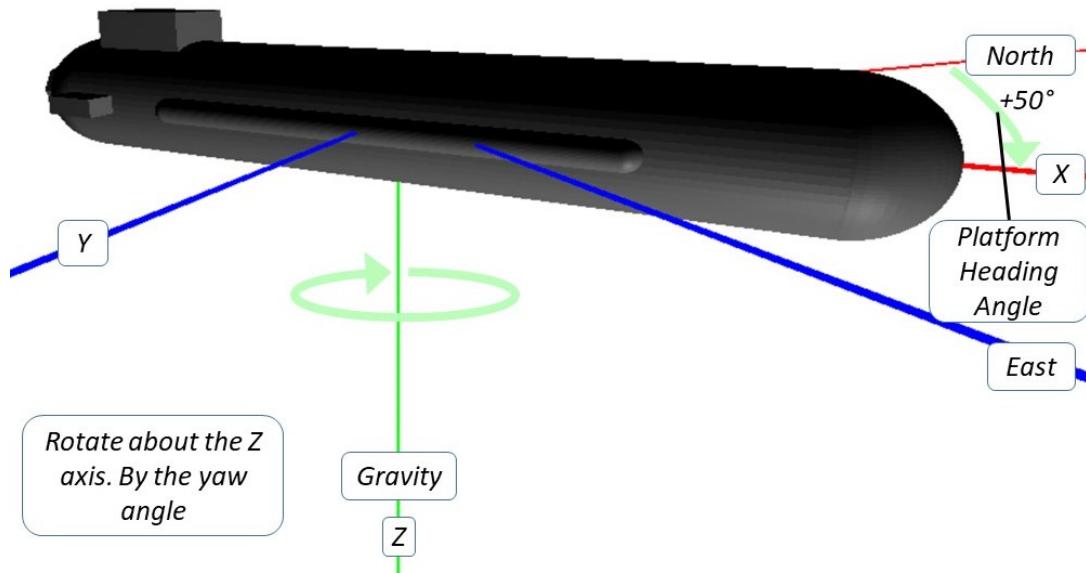

5. Rotate the vehicle about the vehicle's newly oriented Y axis by the pitch angle (Figure 18).

6. Rotate the vehicle about the vehicle's newly oriented X axis by the roll angle (Figure 19).
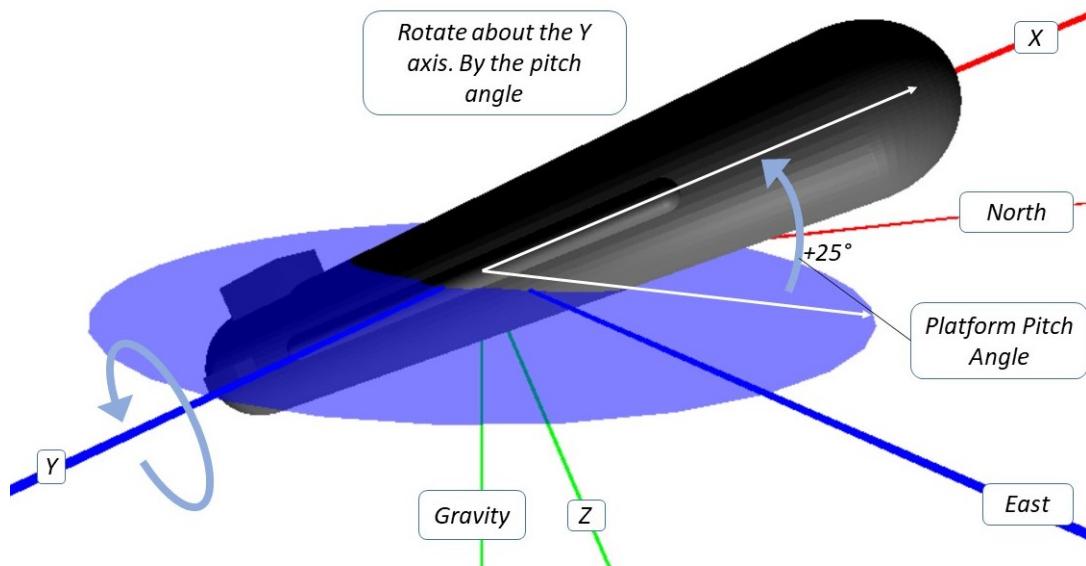

Figure 15: Define the Vehicle Coordinate System

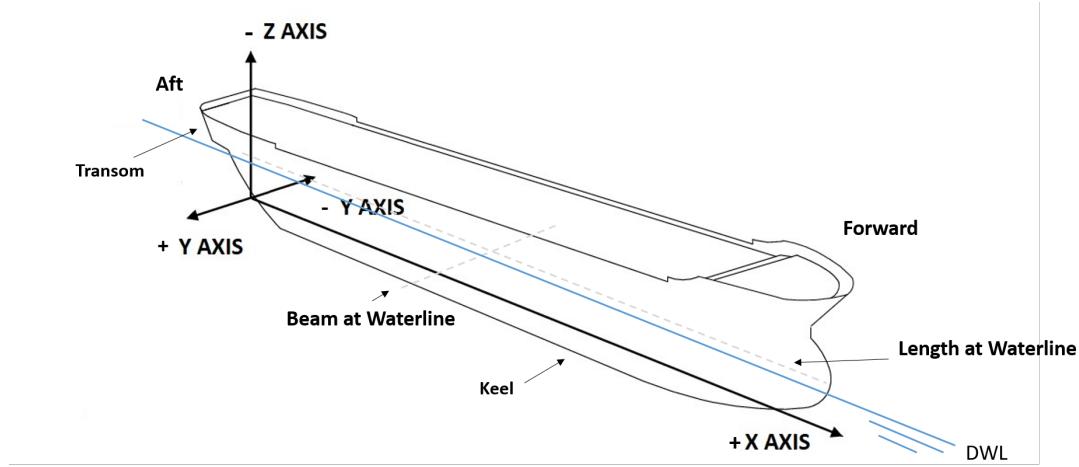

Figure 19: Rotate the Vehicle by the Roll Angle.

4.6   Vehicle Coordinate Reference Frame Origin

UMAA does not specify a required origin for the vehicle coordinate reference frame. However, certain applications may benefit from defining a specific origin such as the registration of multiple sensors with associated offsets for data fusion. Possible origins include the keel/transom intersection, bow/waterline intersection, center of gravity, center of buoyancy and location of INS. A few examples follow.
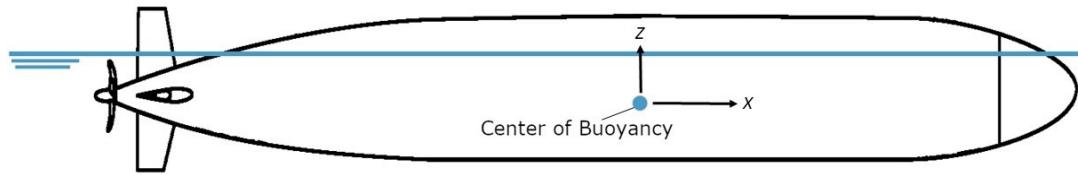

Definitions

- Keel Transom Intersection

  - Beam at Waterline (BWL) - The maximum distance of the vehicle at the waterline, the distance along the Y axis of the widest point of the hull where it meets the waterline.

  - Design Waterline (DWL) - The line representing the waterline on the vehicle at designed load in summer temperature.

  - Keel - The principal fore-and-aft component of a ship's framing, located along the centerline of the bottom and connected to the stem and stern frames.

  - Length at Waterline (LWL) - The measured distance of the vehicle at the level where it sits in the water, measured along the X axis.

  - Transom - The aftermost transverse flat or shaped plating enclosing the hull.

Figure 20: Keel Transom Intersection Origin Location on a USV as Example

- Center of Buoyancy
  - X - The Longitudinal Center of Buoyancy (LCB) when fully submerged.
  - Y - The symmetrical centerline.
  - Z - The Vertical Center of Buoyancy (VCB) when fully submerged.

Figure 21: Center of Buoyancy Origin Location on a UUV as Example.

5   Flow Control

5.1   Command / Response

This section defines the flow of control for command/response over the DDS bus. A command/response controls a specific service. While the exact names and processes will depend on the specific service and command being executed, all command/responses in UMAA follow a similar pattern. A notional "Function" command `FunctionCommand` is used in the following examples. As will be described in subsequent paragraphs, DDS publish/subscribe methods are used in implementations to issue commands and responses.

To direct a `FunctionCommand` at a specific Service Provider, UMAA includes a `destination` GUID in all commands. A Service Provider is required to respond to all `FunctionCommand`s where the `destination` is the same as the Service Provider's ID. The Service Consumer will also create a `sessionID` for the command when commanded. The `sessionID` is used to track the command execution as a key into other command-related messages. The `sessionID` must be unique across all `FunctionCommand` instances that are active (i.e. currently on the DDS bus), otherwise the Service Provider will consider the `FunctionCommand` to be a command update (see Section 5.1.4.2). Once a `FunctionCommand` is removed from the DDS bus as part of the Command Cleanup process (see Section 5.1.5), its `sessionID` may be reused for future commands without triggering a command update; therefore it is not necessary for a Service Provider to maintain a complete history of `sessionID`s.
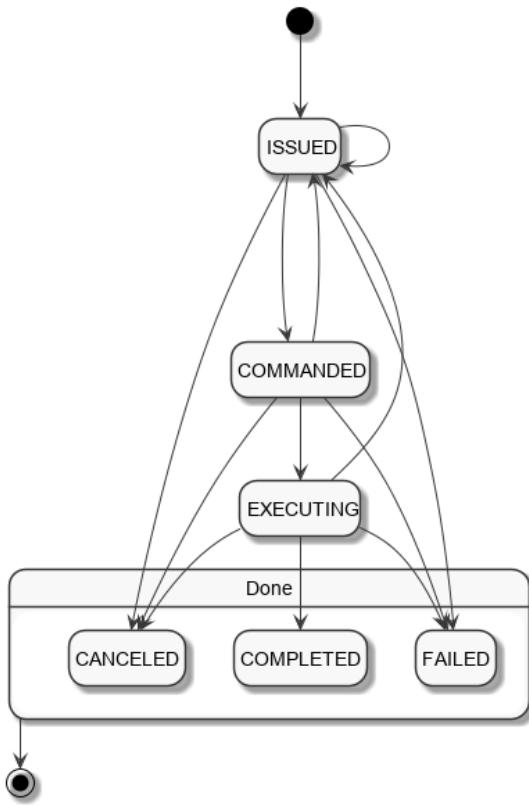

Service Provider and Service Consumer terminology in the following sections is adopted from the OMG Service-oriented architecture Modeling Language (SoaML).

To initialize, a Service Provider (controllable resource) subscribes to the `FunctionCommand` DDS topic. At startup or right before issuing a command, the Service Consumer (controlling resource) subscribes to the `FunctionCommandStatus` DDS topic. Optionally, the Service Consumer may also subscribe to the `FunctionCommandAckReport` to monitor which command is currently being executed, and the `FunctionExecutionStatusReport` (if defined for the Function service) that provides reporting on function-specific data status.

Both Service Providers and Service Consumers are required to recover or clean up any previous persisted commands on the bus during initialization.

To execute a command, the Service Consumer publishes a `FunctionCommandType` to the DDS bus. The Service Provider will be notified and will begin processing the request. During each phase of processing, the Service Provider will provide updates to the Service Consumer via published updates to a related `FunctionCommandStatus` topic. Command responses are correlated to their originating command via the `sessionID`. If a command with a duplicate `sessionID` is received, the Service Provider will regard this as a command update, and follow the flow control detailed in Section 5.1.4.2. Command status updates are provided in the command responses via the `commandStatus` field with additional details included in the `commandStatusReason` field. The Service Provider will also publish the current executing command to the `FunctionCommandAckReport` topic. When defined for the Function service, the Service Provider must also publish the `FunctionExecutionStatusReport` topic and update it as appropriate throughout the execution of the command.

The required state transitions for the `commandStatus` field are shown in Figure 22. Commands may complete normally, or they may terminate early due to failure (Section 5.1.4.4) or cancellation (Section 5.1.4.5). The state machine for a command can also be reset to `ISSUED` via a command update (Section 5.1.4.2). If there is not a self-transition indicated in the diagram, you cannot republish that state in a message. Every command must transition through the states as defined. For example, it is a violation to transition from `ISSUED` to `EXECUTING` without transitioning through `COMMANDED`. Even in the case where there is no logic executing between the `ISSUED` and `EXECUTING` states, the Service Provider is required to transition through `COMMANDED`. This ensures consistent behavior across different Service Providers, including those that do require the `COMMANDED` state.

Figure 22: State transitions of the `commandStatus` as commands are processed.

As described above, each time a command transitions to a new state, a `FunctionCommandStatus` message is published containing the updated `commandStatus` and a `commandStatusReason` that indicates why the state transition happened. The table below shows all valid `commandStatusReason` values for each `commandStatus` transition.

	Ending State					
Starting State	ISSUED	COMMANDED	EXECUTING	COMPLETED	FAILED	CANCELED
Initial State	SUCCEEDED	—	—	—	—	—
ISSUED	UPDATED	SUCCEEDED	—	—	VALIDATION_FAILED RESOURCE_FAILED INTERRUPTED TIMEOUT SERVICE_FAILED	CANCELED
COMMANDED	UPDATED	—	SUCCEEDED	—	RESOURCE_REJECTED INTERRUPTED TIMEOUT SERVICE_FAILED	CANCELED
EXECUTING	UPDATED	—	—	SUCCEEDED	OBJECTIVE_FAILED RESOURCE_FAILED INTERRUPTED TIMEOUT SERVICE_FAILED	CANCELED
COMPLETED	—	—	—	—	—	—
FAILED	—	—	—	—	—	—
CANCELED	—	—	—	—	—	—

Figure 23: Valid `commandStatusReason` values for each `commandStatus` state transition. Entries marked with a (—) indicate that the state transition is invalid.
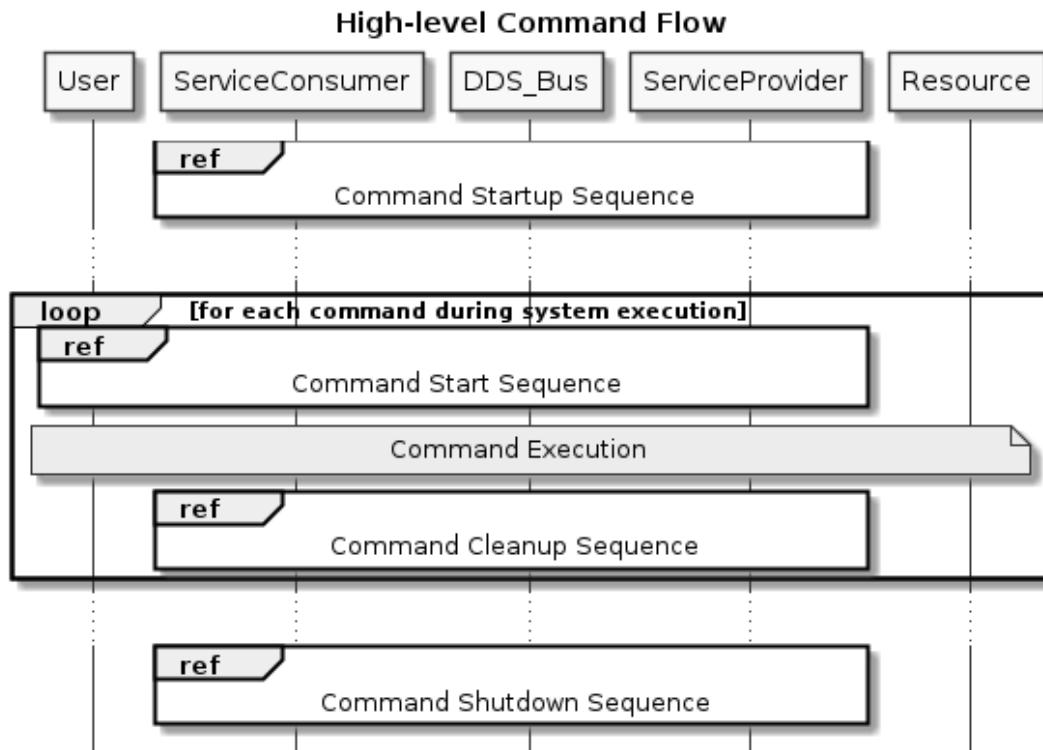

In the following sections, the sequence diagrams demonstrate different exchanges between a Service Consumer and Service Provider. Within the diagrams, the dashed arrows represent implementation-specific communications that are outside of UMAA's scope. These sequence diagrams are just an example of one possible implementation. Other implementations may have different communication patterns between the Service Provider and the Resource or be implemented completely within the Service Provider process itself (no dependency on an external Resource). Likewise, the interactions between the User and Service Consumer may follow similar or different patterns. However, the UMAA-defined exchanges with the DDS bus between the Service Consumer and Service Provider must happen in the order shown within the sequence diagrams.

5.1.1   High-Level Flow

The high-level flow of a command sequence is shown in Figure 24 and can be described as follows:

1. The Command Startup Sequence is performed.

2. For each command to be executed:

    (a) The Command Start Sequence is performed.

    (b) The command is executed (sequence depends on the execution path, i.e., success, failure, or cancel).

    (c) The Command Cleanup Sequence is performed.

3. The Command Shutdown Sequence is performed.

The `ref` blocks will be defined in later sequence diagrams. Note that the duration of the system execution for any particular `FunctionCommandType` is defined by the combination of the Service Provider(s) and Service Consumer(s) in the system and may not be identical to the overall system execution duration. For example, providers may only be available to execute certain commands during specific mission phases or when certain hardware is in specific configurations. This Command Startup Sequence is not required to happen during a system startup phase. The only requirement is that it must be completed by at least one Service Provider and one Service Consumer before any `FunctionCommandType` commands can be fully executed. Likewise, the Command Shutdown sequence may occur at any time the `FunctionCommandType` will no longer be supported. There is no requirement stating that the Command Shutdown Sequence only be performed during a system shutdown phase.
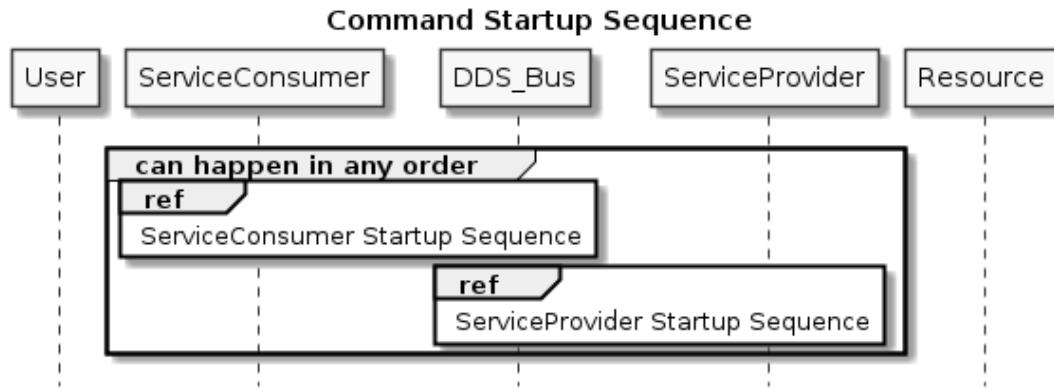

Figure 24: Sequence Diagram for the High-Level Description of a Command Execution.

5.1.2 Command Startup Sequence

As part of initialization both the Service Provider and Service Consumer are required to perform a startup sequence. This startup prepares the Service Provider to execute commands and the Service Consumer to request commands and monitor the progress of those requested commands.

The Service Provider and Service Consumer can initialize in any order. Commands will not be completely executed until both have completed their initialization. The sequence diagram is shown in Figure 25.
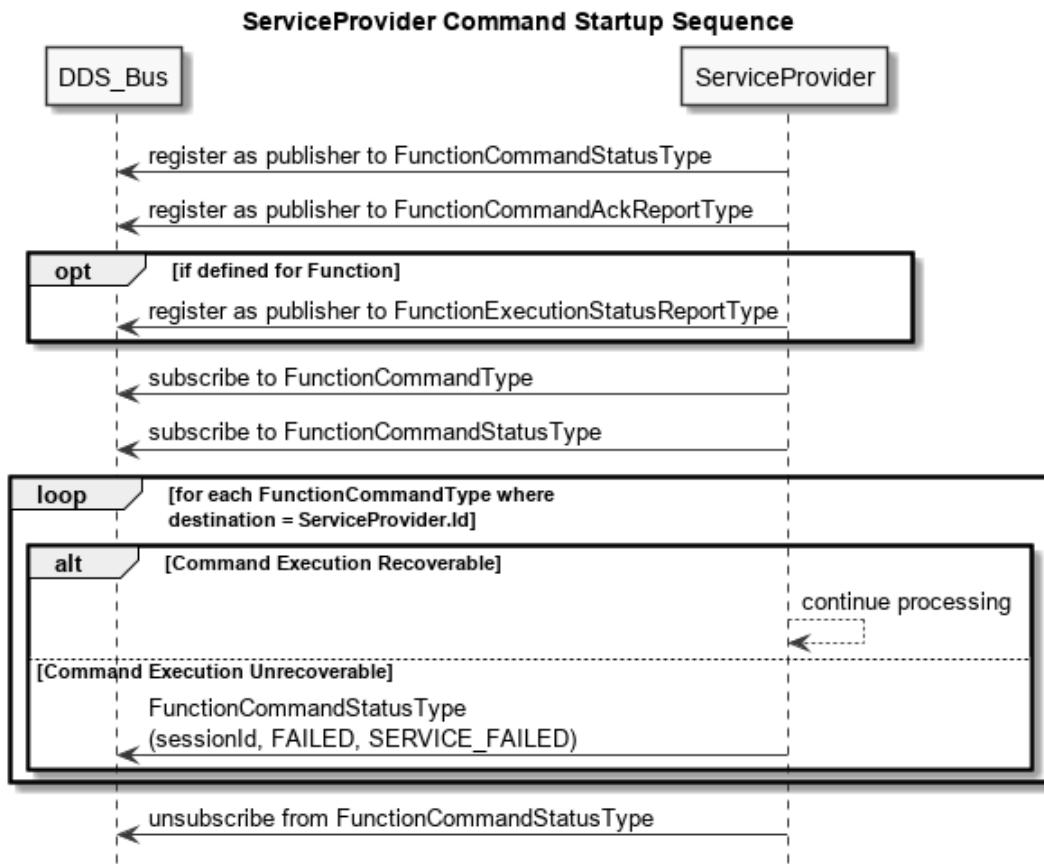

Figure 25: Sequence Diagram for Command Startup.

5.1.2.1 Service Provider Startup Sequence During startup, the Service Provider is required to register as a publisher to the `FunctionCommandStatus`, `FunctionCommandAckReport`, and (if defined for the Function service) the `FunctionExecutionStatusReport` topics.

The Service Provider is also required to subscribe to the `FunctionCommand` topic to be notified when new commands are published.

Finally, the Service Provider is required to handle any existing `FunctionCommandType` commands persisted on the DDS bus with the Service Provider's ID. For each command, if the Service Provider can and wishes to recover, it can continue to execute the command. To obtain the last published state of the command, the Service Provider must subscribe to the `FunctionCommandStatusType`. The Service Provider will continue following the normal status update sequence, picking up from the last status on the bus. If the Service Provider cannot or chooses not to continue processing the command, it must fail the command by publishing a `FunctionCommandStatus` with a `commandStatus` of `FAILED` and a `reason` of `SERVICE_FAILED`.

The Service Provider Startup sequence is shown in Figure 26.
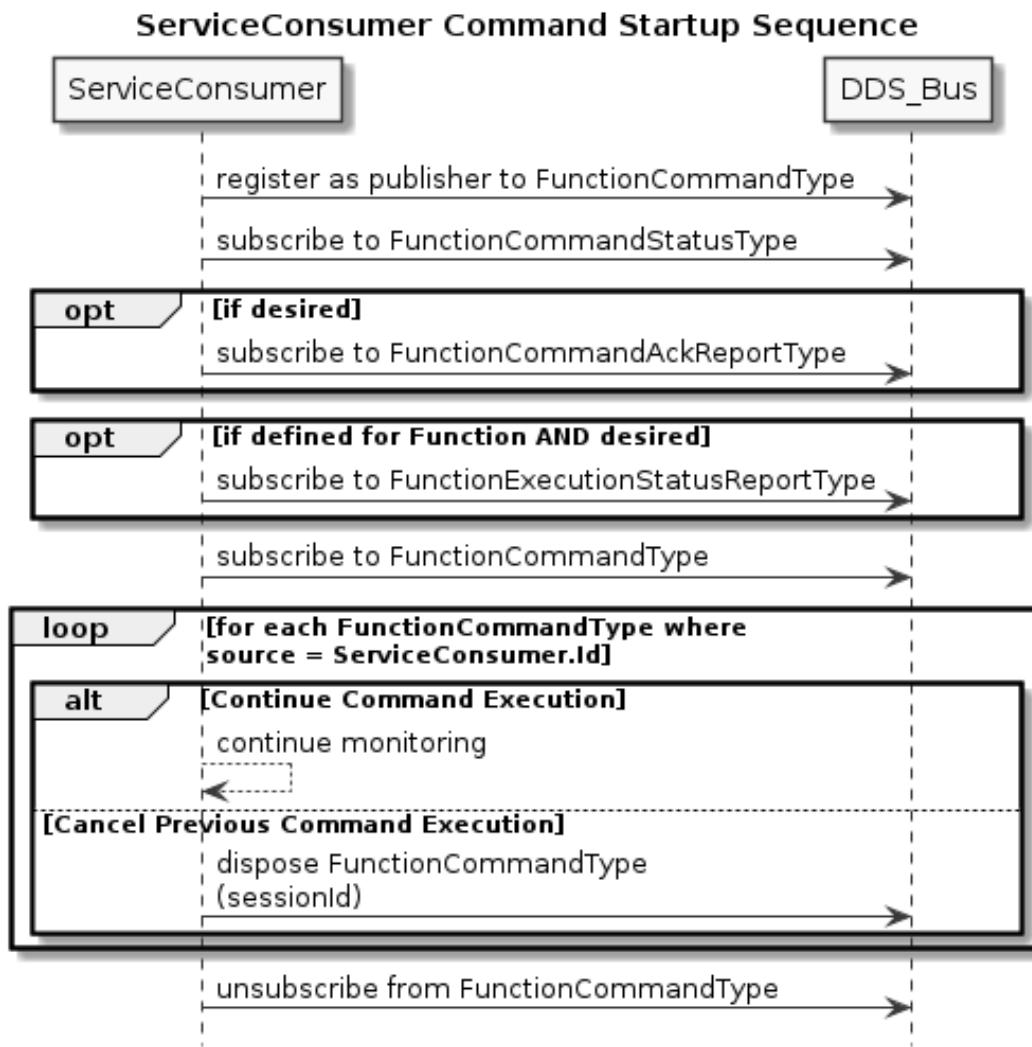

Figure 26: Sequence Diagram for Command Startup for Service Providers.

5.1.2.2   Service Consumer Startup Sequence   During startup, the Service Consumer is required to register as a publisher of the `FunctionCommandType`.

The Service Consumer is also required to subscribe to the `FunctionCommandStatusType` to monitor the execution of any published commands. The Service Consumer can optionally register for the `FunctionCommandAckReportType` and, if defined for the Function service, the `FunctionExecutionStatusReportType` if it desires to track additional status of the execution of commands.

Finally, the Service Consumer is required to handle any existing `FunctionCommandType` commands persisted on the DDS bus with this Service Consumer's ID. To find existing `FunctionCommandType`s on the bus, it must first subscribe to the topic. If the Service Consumer can and wishes to recover, it can continue to monitor the execution of the command. If the Service Consumer cannot or chooses not to continue the execution of the command, it must cancel the command via the normal command cancel method.

The Service Consumer Startup sequence is shown in Figure 27.

Figure 27: Sequence Diagram for Command Startup for Service Consumers.

5.1.3   Command Execution Sequences

Once both the Service Provider and Service Consumer have performed the startup sequence, the system is ready to begin issuing and executing commands.
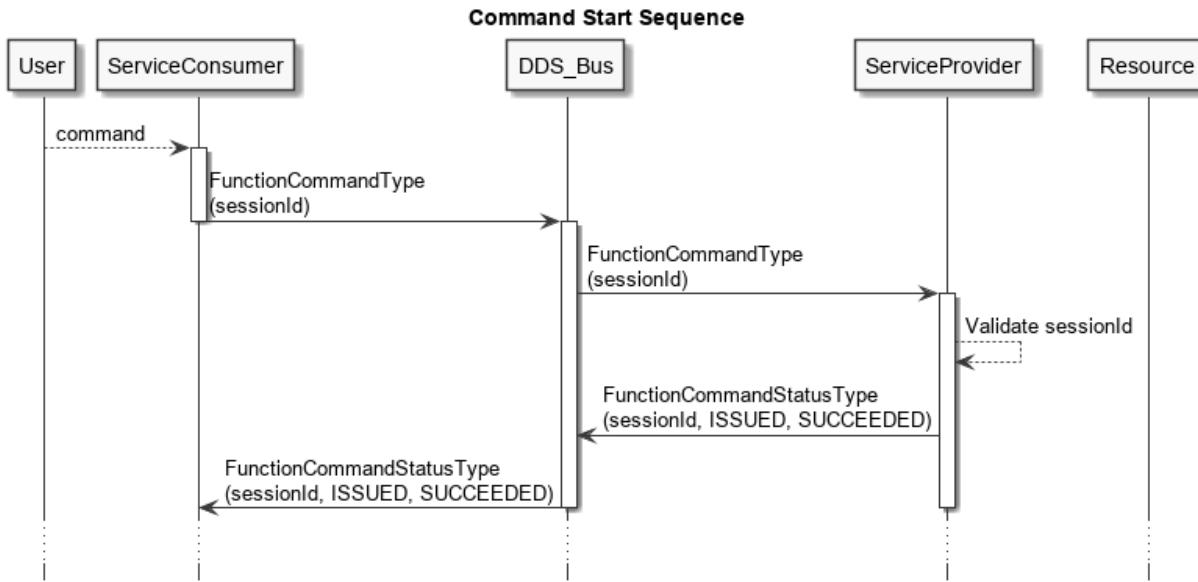

5.1.4   Command Start Sequence

The initial start sequence to execute a single new command follows this pattern:

1. The User of the Service Consumer issues a request for a command to be executed.

2. The Service Consumer publishes the `FunctionCommandType` with a unique session ID, the source ID of the Service Consumer, and the destination ID of the desired Service Provider.

3. The Service Provider, upon notification of the new `FunctionCommandType`, publishes a new `FunctionCommandStatusType` with (1) the same session ID as the new `FunctionCommandType`, (2) the status of `ISSUED` and (3) the reason of `SUCCEEDED` to notify the Service Consumer it has received the new command.

The Command Start Sequence for a new command is shown in Figure 28. This pattern will be repeated each time a new command is requested. Note that the Command Start Sequence differs if the `FunctionCommandType` has a `sessionID` that matches another `FunctionCommandType` that currently exists on the DDS bus. This is considered a command update and detailed in Section 5.1.4.2.

After the Command Start Sequence, the sequence can take different paths depending on the actual execution of the command, detailed from Section 5.1.4.1 to Section 5.1.4.5, but they do not enumerate all of the possible execution paths. Other paths (e.g., an objective failing) will follow a similar pattern to other failures; all are required to follow the state diagram shown in Figure 22 and eventually end with the Command Cleanup Sequence (shown in Figure 35).

Command Start Sequence
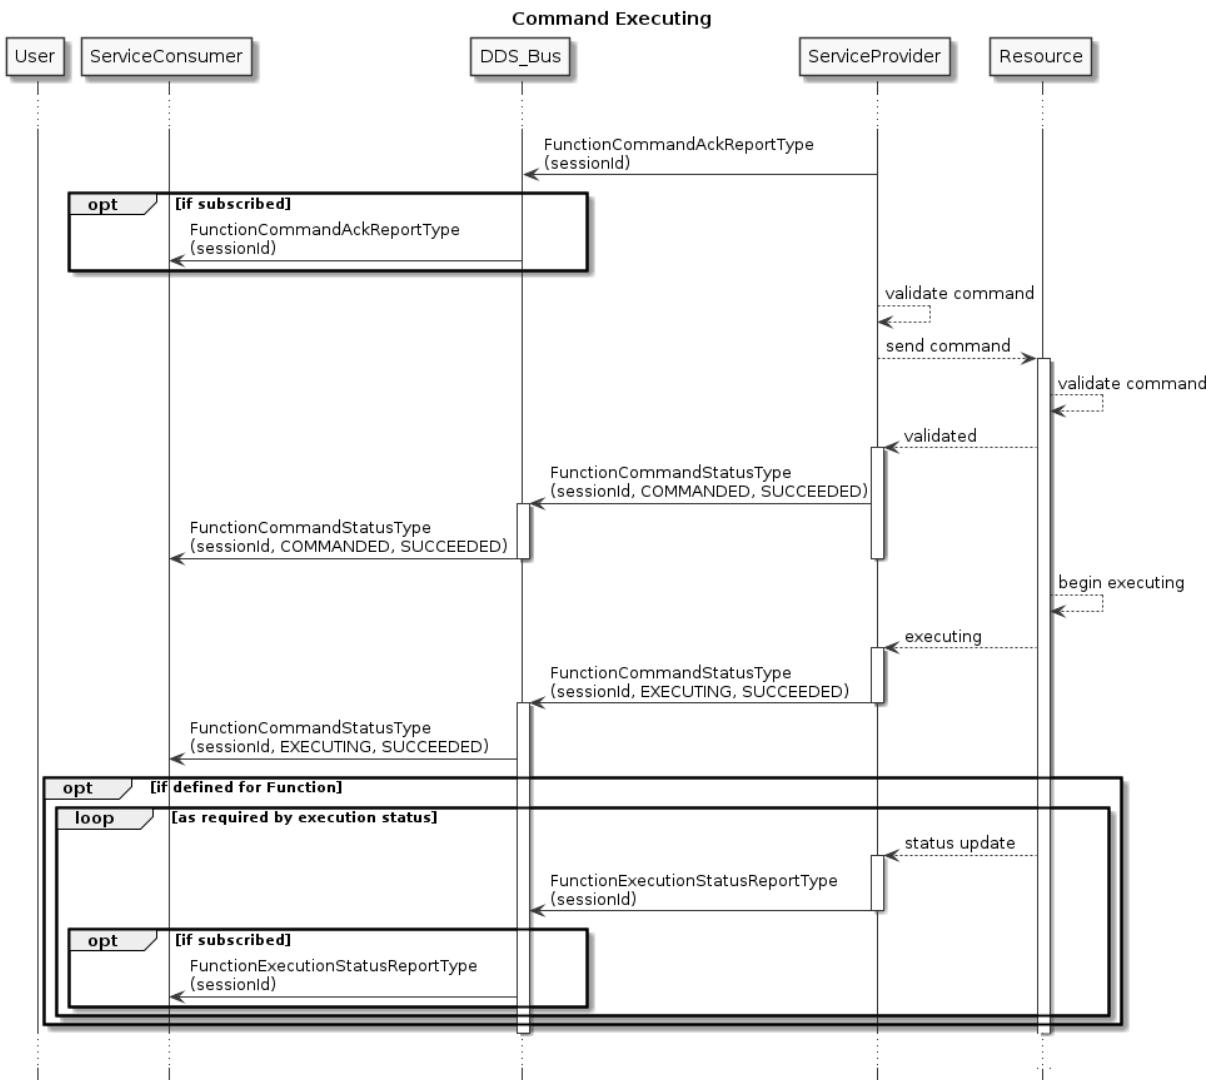

Figure 28: Sequence Diagram for the Start of a Command Execution.

5.1.4.1 Command Execution   Once a Service Provider starts to process a command, the Command Execution sequence is:

1. The Service Provider publishes a `FunctionCommandAckReportType` with matching session ID and parameters as the `FunctionCommandType` it is starting to process.

2. The Service Provider performs any validation and negotiation with backing resources as necessary. Once the command is ready to be executed, the Service Provider publishes a `FunctionCommandStatusType` with a status `COMMANDED` and reason `SUCCEEDED` to notify the Service Consumer that the command has been validated and commanded to start execution.

3. Once the command has begun executing, the Service Provider publishes a `FunctionCommandStatusType` with a status `EXECUTING` and reason `SUCCEEDED` to notify the Service Consumer that the command has been validated and commanded to start.

4. If the Function has a defined `FunctionExecutionStatusReportType`, the Service Provider must publish a new instance with matching session ID as the associated `FunctionCommandType`. The `FunctionExecutionStatusReportType` must be updated by the Service Provider throughout the execution as dictated by the definitions of the command-specific attributes in the execution status report.

The command execution sequence is shown in Figure 29. This sequence holds until the command completes execution.

Figure 29: Beginning Sequence Diagram for a Command Execution.

The normal successful conclusion of a command being executed in some cases is initiated by the Service Consumer (an endless GlobalVector command concluded by canceling it) and in other cases is initiated by the Service Provider (a GlobalWaypoint commanded concluded by reaching the last waypoint). Unless otherwise explicitly stated, it is assumed the Service Provider will be able to identify the successful conclusion of a command. In the cases where commands are defined to be indeterminate the Service Consumer must cancel the command when the Service Consumer no longer desires the command to be executed.
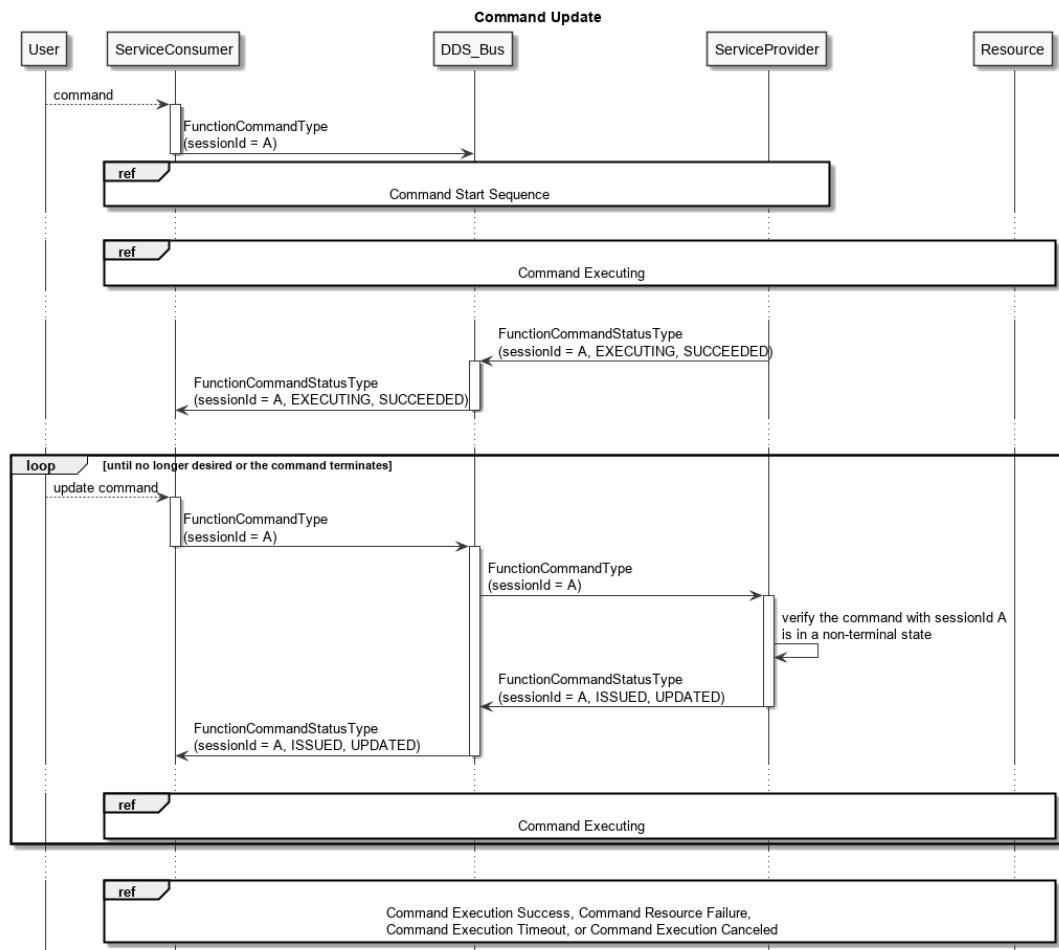

5.1.4.2   Updating a Command   An updated command is defined as a command with a source ID and session ID identical to the current command being processed by the Service Provider, but whose timestamp is newer than the current command. Only a command that is in a non-terminal state may be updated - otherwise, the Service Consumer must follow the normal command cleanup process and issue a new command with an updated unique session ID. If a command is in a terminal state, the Service Provider must ignore an update to that command.

When the Service Provider receives an updated command, it is required to take one of two possible actions:

1. If the current command is in a non-terminal state (`ISSUED`, `COMMANDED`, or `EXECUTING`), then the Service Provider publishes a `FunctionCommandStatusType` with a status `ISSUED` and reason `UPDATED`. The state machine then restarts and proceeds through the normal command flow detailed in 5.1.4. The Service Provider must consider the updated command as an entirely new command, resetting any internal state related to the command (e.g. a timer that keeps track of command timeout).

2. If the current command is in a terminal state (`COMPLETED`, `CANCELED`, or `FAILED`), then the updated command cannot be processed, and the Service Provider must publish a `FunctionCommandStatusType` with a status `FAILED` and follow the normal command cleanup process.
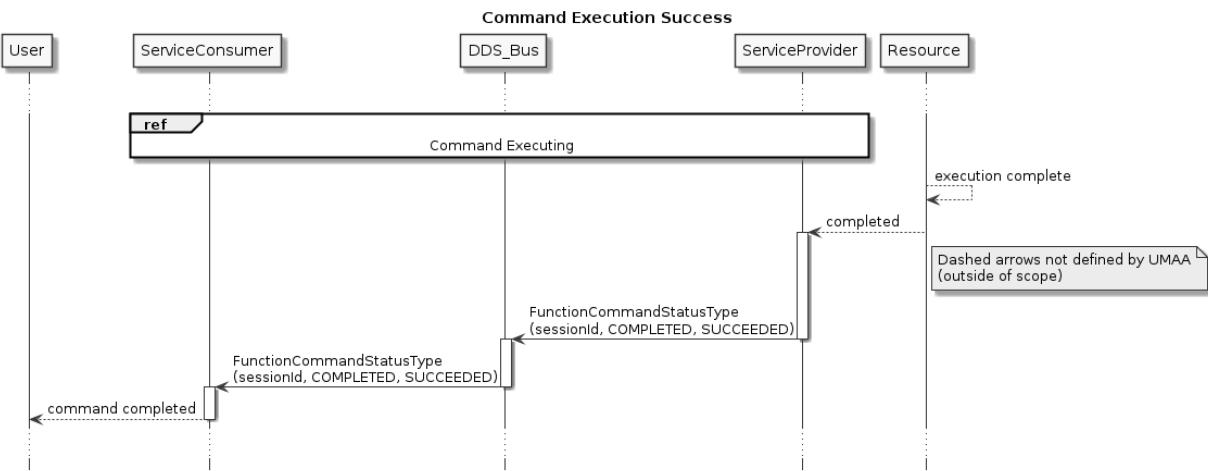

The flow control for command update is detailed below:

Figure 30: Sequence Diagram for Command Update.

5.1.4.3 Command Execution Success   When the Service Provider determines a command has successfully completed, it must update the associated `FunctionCommandStatusType` with as status of `COMPLETED` and reason of `SUCCEEDED`. This signals to the Service Consumer that the command has completed successfully.

The Command Execution Success sequence is shown in Figure 31.
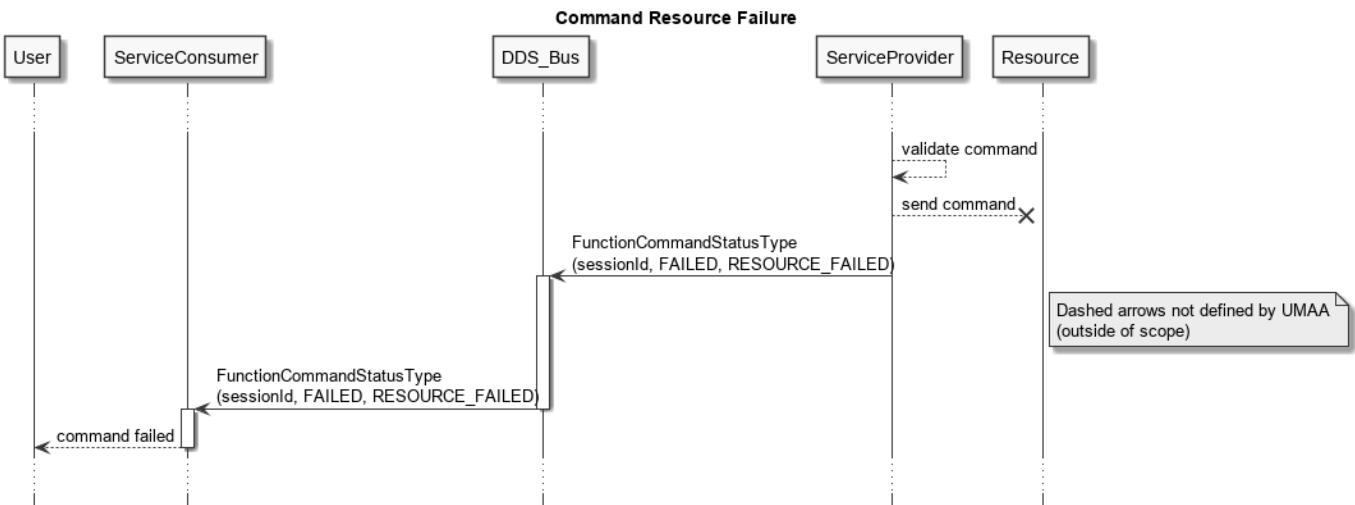

Figure 31: Sequence Diagram for a Command That Completes Successfully.

5.1.4.4   Command Execution Failure   The command may fail to complete for any number of reasons including software errors, hardware failures, or unfavorable environmental conditions. The Service Provider may also reject a command for a number of reasons including inability to perform the task, malformed or out of range requests, or a command being interrupted by a higher priority process. In all cases, the Service Provider must publish a `FunctionCommandStatusType` with an identical `sessionID` as the originating `FunctionCommandType` with a status of `FAILED` and the reason that reflects the cause of the failure (`VALIDATION_FAILED, SERVICE_FAILED, OBJECTIVE_FAILED,` etc).
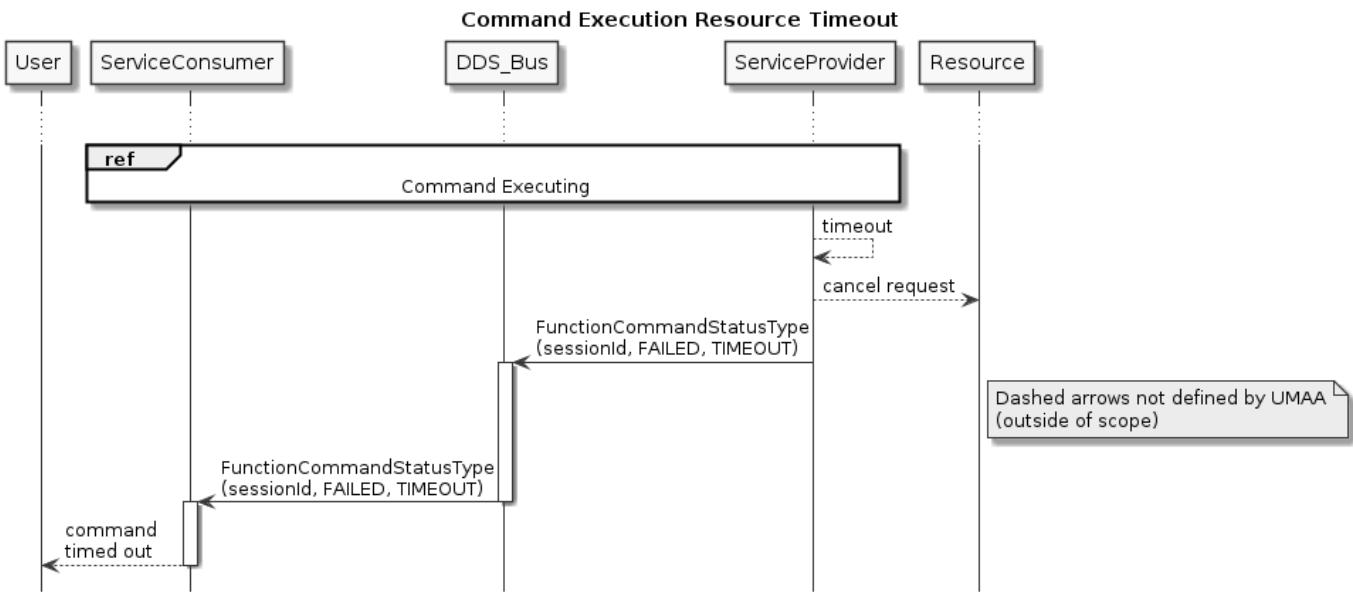

Figure 32 and Figure 33 provide examples where a command has failed.

In the first example, the backing Resource failed and the Service Provider is unable to communicate with it. In this case, the Service Provider will report a `FunctionCommandStatusType` with a status of `FAILED` and a reason of `RESOURCE_FAILED`. This is shown in Figure 32.

Figure 32: Sequence Diagram for a Command That Fails due to Resource Failure.

In the second example, the Resource takes too long to respond, so the Service Provider cancels the request and reports a `FunctionCommandStatusType` with a status of `FAILED` and a reason of `TIMEOUT`. This is shown in Figure 33.

Figure 33: Sequence Diagram for a Command That Times Out Before Completing.
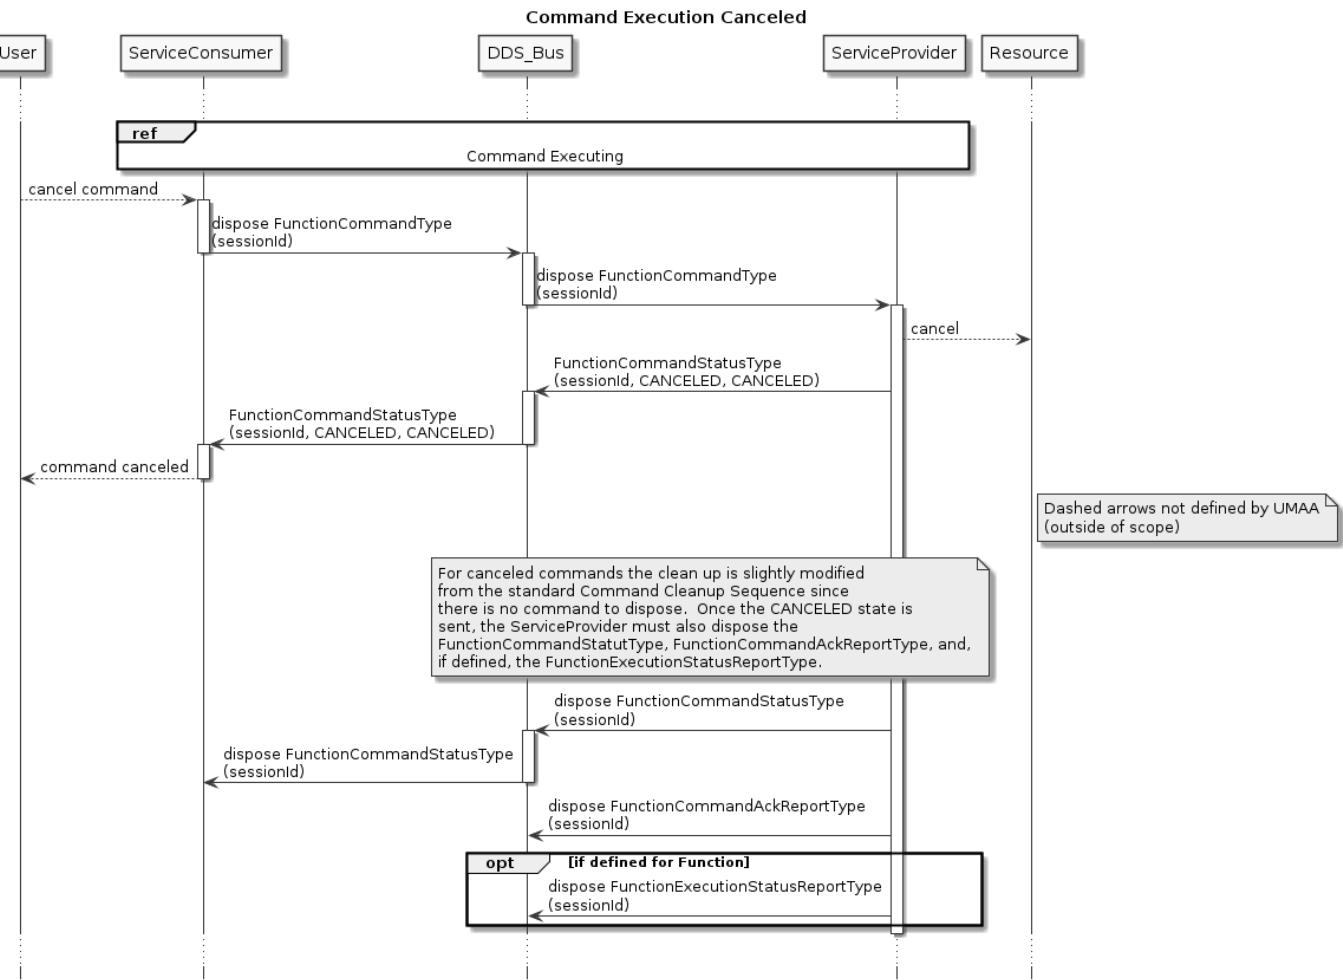

Other failure conditions will follow a similar pattern: when the failure is recognized, the Service Provider will publish a `FunctionCommandStatusType` with a status of `FAILED` and a reason that reflect the cause of the failure.

5.1.4.5   Command Canceled   The Service Consumer may decide to cancel the command before processing is finished. To signal a desire to cancel a command, the Service Consumer disposes of the existing `FunctionCommandType` from the DDS bus before the execution is complete. When notified of the command disposal, and if the Service Provider is able to cancel the command, it should respond to the Service Consumer with a `FunctionCommandStatusType` with both the status and reason as `CANCELED`. At this point, the DDS bus should dispose of the `FunctionCommandStatusType`, the `FunctionCommandAckReportType` and, (if defined for the Function service) the `FunctionExecutionStatusReportType`. This is shown in Figure 34. If the command cannot be canceled, then the Service Provider can continue to update the command status until the execution is completed. Reporting will include `FunctionCommandStatusType` with a status of `COMPLETED` and a reason of `SUCCEEDED`. Then, the DDS bus should dispose of the `FunctionCommandStatusType`, the `FunctionCommandAckReportType`, and (if defined for the Function service) the `FunctionExecutionStatusReportType`.

There is no new, unique, or specific status message response to a cancel command from the Service Provider. The cancel command status can be inferred through the corresponding `FunctionCommandStatusType` status and reason updates.

On loss of liveliness of a Service Provider while executing a command, all Service Consumers must cancel (dispose) all in-process commands with that Service Provider.

On loss of liveliness of a Service Consumer while executing a command, all Service Providers must treat the command as canceled. This means the service should report the `CANCELED` status for the command, and then dispose the command status, ack, and execution status (if one exists).
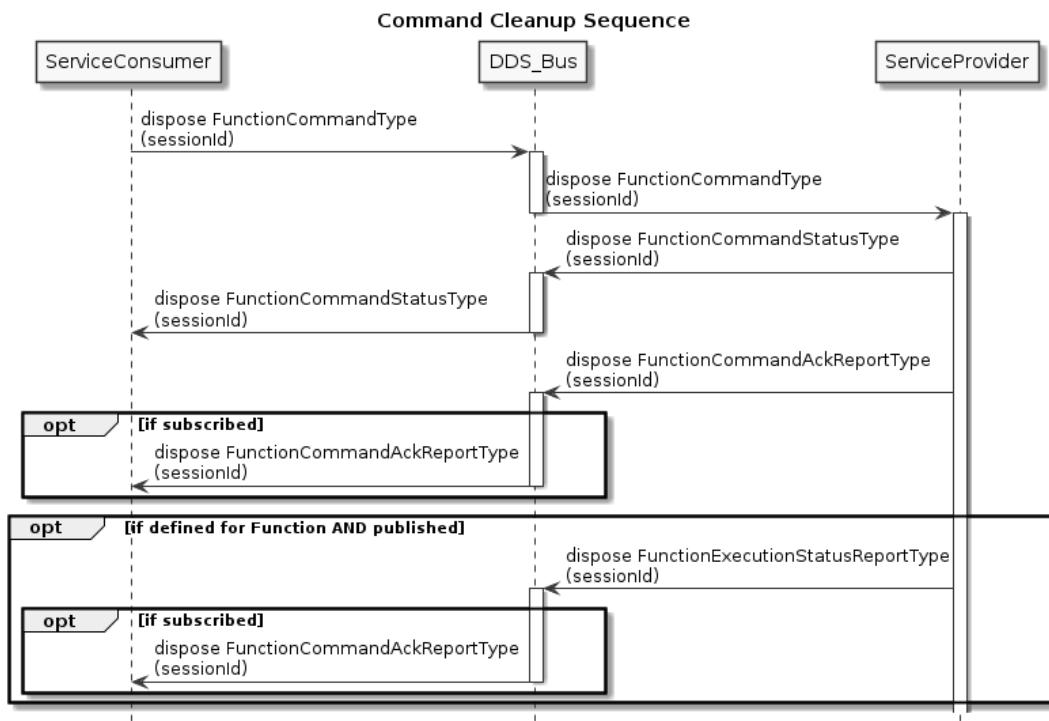

Figure 34: Sequence Diagram for a Command That is Canceled by the Service Consumer Before the Service Provider can Complete It.

5.1.5   Command Cleanup

The Service Consumer and Service Provider are responsible for disposing of corresponding data that is published to the DDS bus when the command is no longer active. With the exception of a canceled command, the signal that a `FunctionCommandType` can be disposed is when the `FunctionCommandStatusType` reports a terminal state (`COMPLETED` or `FAILED`)[3]. In turn, the signal that a `FunctionCommandStatusType`, `FunctionCommandAckReportType`, and (if defined for the Function service) the `FunctionExecutionStatusReportType` can be disposed is when the corresponding `FunctionCommandType` has been disposed. This is shown in Figure 35.

---

[3]While `CANCELED` is also a terminal state, the `CANCELED` command cleanup is handled specially as part of the cancelling sequence and, as such, does not need to be handled here.
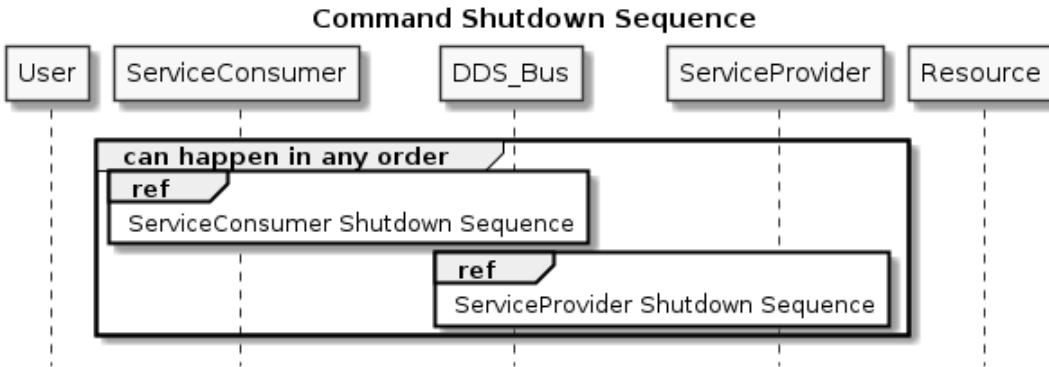

Figure 35: Sequence Diagram Showing Cleanup of the Bus When a Command Has Been Completed and the Service Consumer No Longer Wishes to Maintain the Commanded State.

5.1.6   Command Shutdown Sequence

As part of shutdown, both the Service Provider and Service Consumer are required to perform a shutdown sequence. This shutdown cleans up resources on the DDS bus and informs the system that the Service Provider and Service Consumer are no longer available.

The Service Provider and Service Consumer can shut down in any order. The sequence diagram is shown in Figure 36.
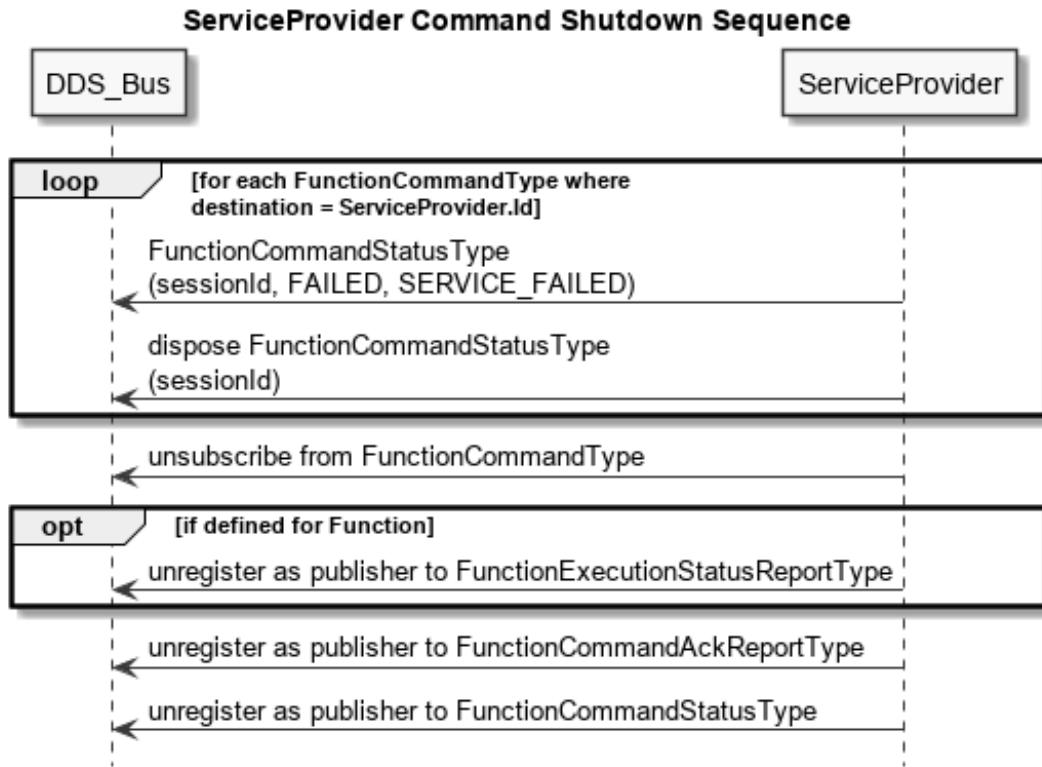

Figure 36: Sequence Diagram for Command Shutdown.

5.1.6.1   Service Provider Shutdown Sequence   During shutdown, the Service Provider is required to fail any incomplete requests and then unregisters as a publisher of the `FunctionCommandStatusType`, `FunctionCommandAckReportType`, and (if defined for the Function service) the `FunctionExecutionStatusReportType`.

The Service Provider is also required to unsubscribe from the `FunctionCommandType`.

The Service Provider Shutdown sequence is shown in Figure 37.

ServiceProvider Command Shutdown Sequence
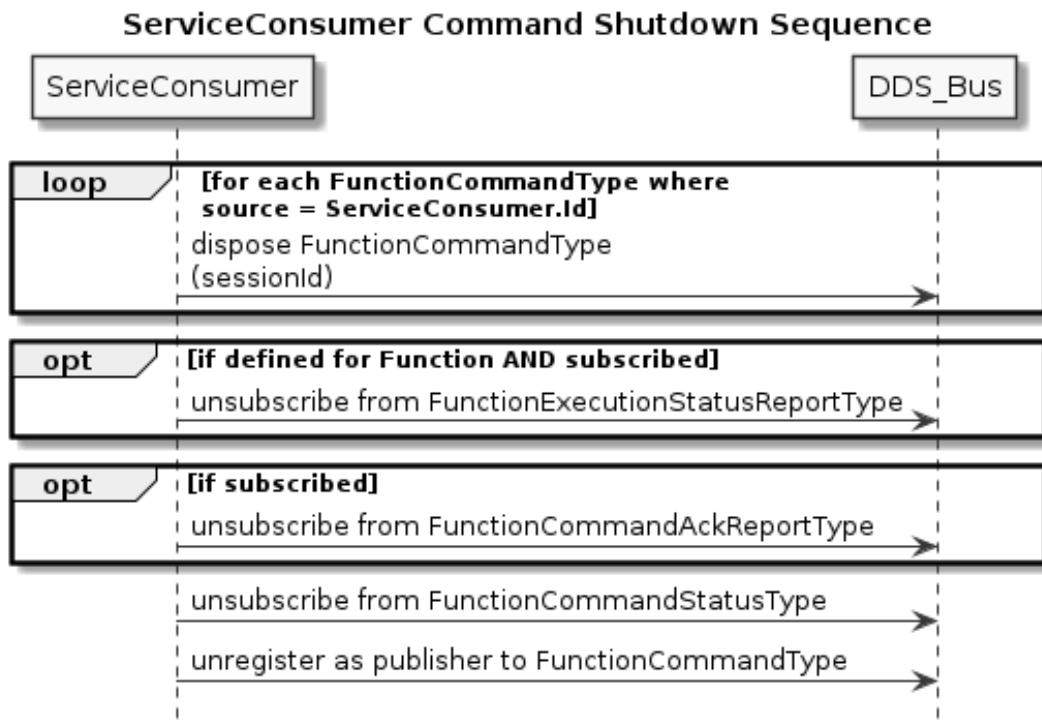

Figure 37: Sequence Diagram for Command Shutdown for Service Providers.

5.1.6.2   Service Consumer Shutdown Sequence   During shutdown, the Service Consumer is required to cancel any incomplete requests and then unregister as a publisher of the `FunctionCommandType`.

The Service Consumer is also required to unsubscribe from the `FunctionCommandStatusType`, the `FunctionCommandAckReportType` if subscribed, and the `FunctionExecutionStatusReportType` if defined for the Function service and subscribed.

The Service Consumer Shutdown sequence is shown in Figure 38.

Figure 38: Sequence Diagram for Command Shutdown for Service Consumers.

5.2   Request / Reply
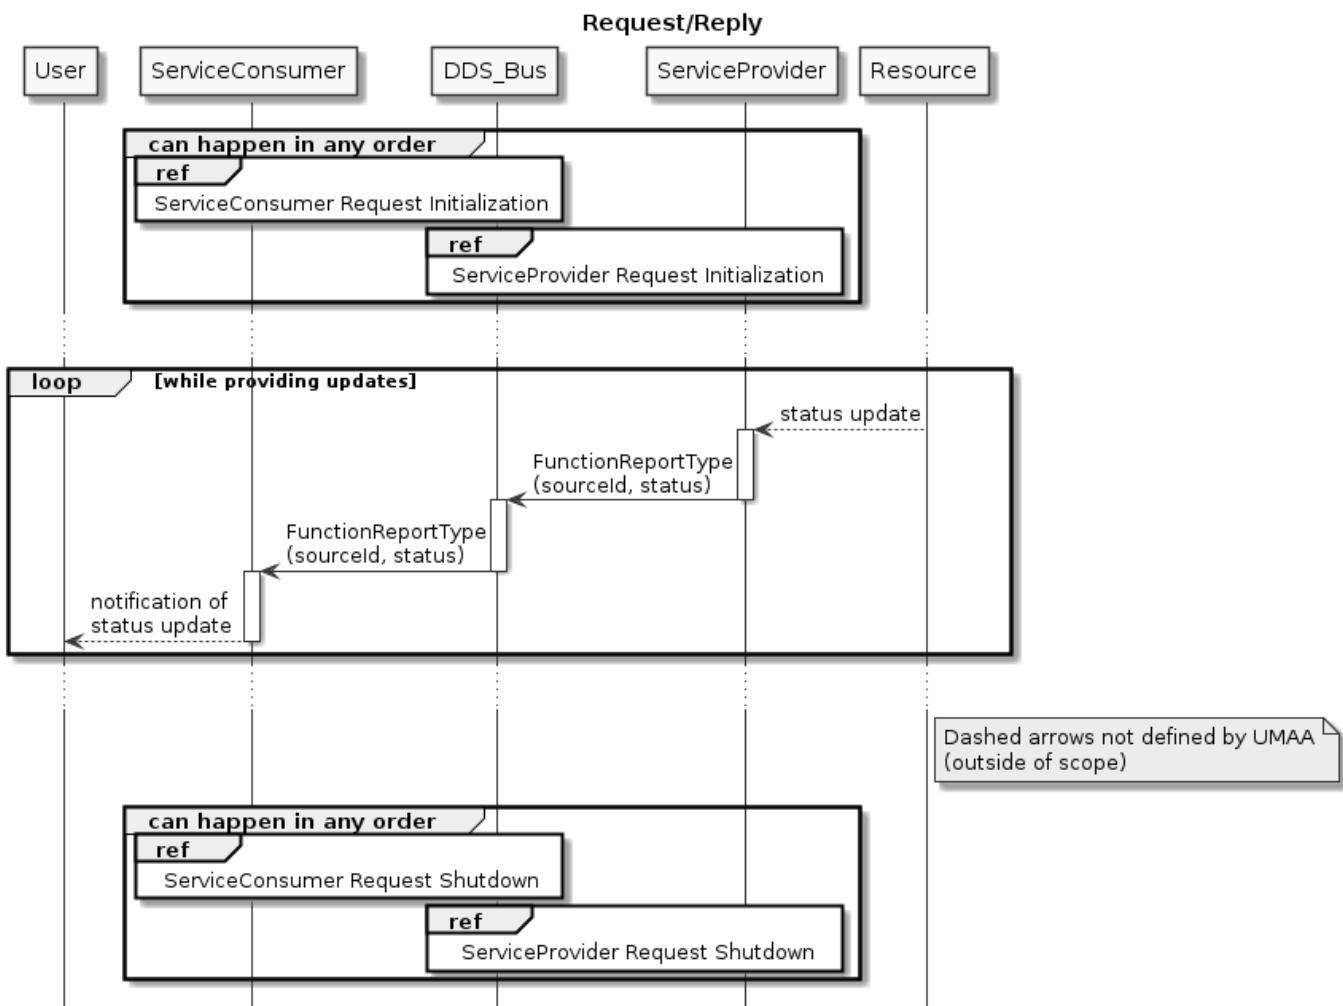

This section defines the flow of control for request/reply over the DDS bus. A request/reply is used to obtain data or status from a specific Service Provider.

A Service Provider is required to reply to all requests it receives. In the case of requests with no query data, this is accomplished via a DDS subscribe. In the case of a request with associated query data, a message with the query data must be published by the requester. To direct a request at a specific Service Provider or set of services, UMAA defines a `destination` GUID as part of requests.

The sequence diagrams in Sections 39 through 43 demonstrate different exchanges between a Service Consumer and Service Provider. Within the diagrams, the dashed arrows represent implementation-specific communications that are outside of UMAA's scope. Additionally, these sequence diagrams are examples of one possible implementation. Other implementations may have different communication patterns between the Service Provider and the Resource, or be implemented completely within the Service Provider process itself (no external Resource). However, in all implementations, UMAA-defined exchanges with the DDS bus between the Service Consumer and Service Provider must happen in the order shown within the sequence diagrams.

5.2.1   Request/Reply without Query Data

Figure 39 shows the sequence of exchanges in the case where there is no specific query data (i.e., the service is always just providing the current data to the bus).

Figure 39: Sequence Diagram for a Request/Reply for Report Data That Does Not Require any Specific Query Data.

5.2.1.1   Service Provider Startup Sequence   The Service Provider registers as a publisher of `FunctionReportType`s to be able to respond to requests. The Service Provider must also handle reports that exist on the bus from a previous instantiation, either by providing an immediate update or, if the status is unrecoverable, disposing of the old `FunctionReportType`. This is shown in Figure 40.

As `FunctionReportType` updates are required (either through event-driven changes or periodic updates), the Service Provider publishes the updated data. The DDS bus will deliver the updates to the Service Consumer.
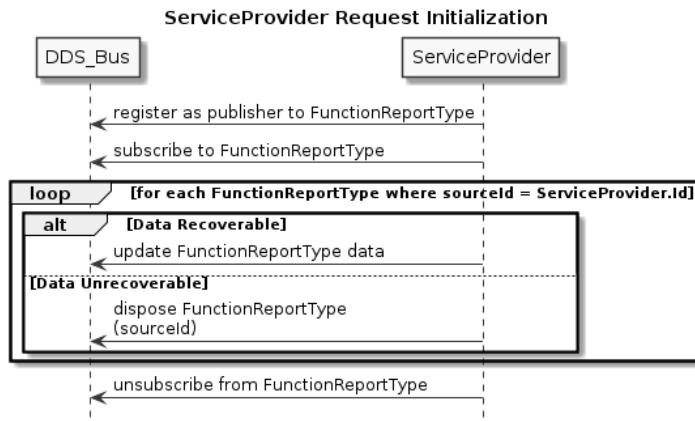

Figure 40: Sequence Diagram for Initialization of a Service Provider to Provide `FunctionReportType`s.

5.2.1.2   Service Consumer Startup Sequence   The Service Consumer subscribes to the `FunctionReportType` to signal an outstanding request for updates. This is shown in Figure 41.
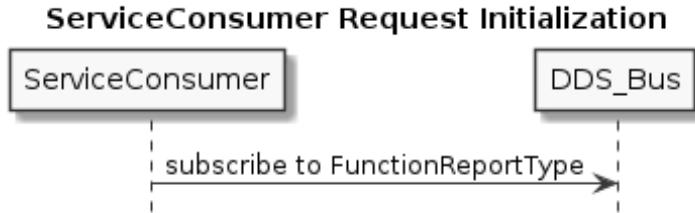

Figure 41: Sequence Diagram for Initialization of a Service Consumer to Request `FunctionReportType`s.

5.2.1.3   Service Provider Shutdown   To no longer provide `FunctionReportType`s, the Service Provider disposes of the `FunctionReportType` and unregisters as a publisher of the data (shown in Figure 42).
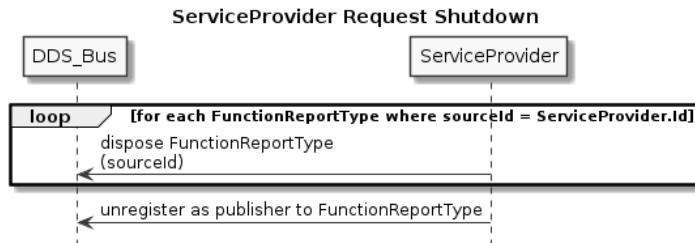

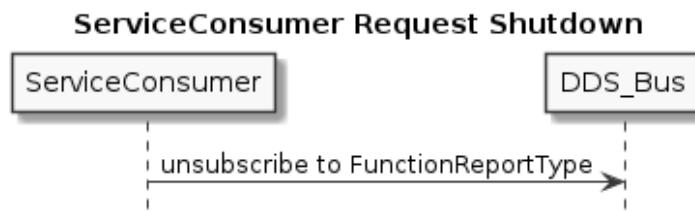

Figure 42: Sequence Diagram for Shutdown of a Service Provider.

5.2.1.4   Service Consumer Shutdown   To no longer request `FunctionReportType`s, the Service Consumer unsubscribes from `FunctionReportType` (shown in Figure 43).

Figure 43: Sequence Diagram for Shutdown of a Service Consumer.

5.2.2 Request/Reply with Query Data

Currently, UMAA does not define any request/reply interactions with query data, but it is expected that some will be defined. When defined, this section will be expanded to describe how they must be used.

6   Situational Awareness (SA) Services and Interfaces

6.1   Services and Interfaces

The interfaces in the following subsections describe how each UCS-UMAA topic is defined by listing the name, namespace, and member attributes. The "name" corresponds with the message name of a given service interface. The "namespace" defines the scope of the "name" where similar commands are grouped together. The "member attributes" are fields that can be populated with differing data types, e.g. a generic "depth" attribute could be populated with a double data value. Note that using a UCS-UMAA "Topic Name" requires using the fully-qualified namespace plus the topic name.

Each interface topic is referenced by a UMAA service and is defined as either an input or output interface.

Attributes ending in one or more asterisk(s) denote the following:
* = Key (annotated with @key in IDL file; vendors may use different notation to indicate a key field)
† = Optional (annotated with @optional in IDL file; vendors may use different notation to indicate an optional field)

Optional fields should be handled as described in the UMAA Compliance Specification.

Commands issued on the DDS bus must be treated as if they are immutable in UMAA and, therefore, if updated (treated incorrectly as mutable), the resulting service actions are indeterminate and flow control protocols are no longer guaranteed.

Operations without DDS Topics

⊕ = Operations that are handled directly in DDS

query<...> - All query operations are used to retrieve the correlated report message. For UMAA, this operation is accomplished through subscribing to the appropriate DDS topic.

cancel<...> - All cancel operations are used to nullify the current command. For UMAA, this operation is accomplished through the DDS dispose action on the publisher.

report<...>CancelCommandStatus - All cancel reports are included here to show completeness of the MDE model mapping to UMAA. For UMAA, this operation is not used. Instead, the cancel status is inferred from the associated command status. If the cancel command is successful, the corresponding command will fail with a command status and reason of CANCELED. If the corresponding command status reports COMPLETED, then this cancel command has failed.

6.1.1   ContactCOLREGSClassificationStatus

The purpose of this service is to provide the vehicles and/or the operator with the COLREGS classification to existing contacts for situational awareness in the operational area.

Table 8: ContactCOLREGSClassificationStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryContactCOLREGSClassification⊕	reportContactCOLREGSClassification

altitude†	MSLAltitude	The current orthometric height above the Geoid (Mean Sea Level) of the vehicle.
altitudeAGL†	DistanceAGL	The current height above ground level of the vehicle.
altitudeASF†	DistanceASF	The current height above the sea floor of the vehicle.
altitudeGeodetic†	GeodeticAltitude	The current geodetic height above the ellipsoid of the vehicle.
attitude	Orientation3DNEDType	The current orientation (roll, pitch, yaw) of the vehicle.
attitudeCovariance†	CovarianceOrientationNEDType	The current error covariance value of the attitude data.
course	CourseTrueNorth	The current course angle used for the vehicle.
depth†	DistanceBSL	The current depth of the maritime vehicle.
navigationSolution	NavigationSolutionEnumType	The desired navigation solution (estimated or measured).

Attribute Name	Attribute Type	Attribute Description
position	GeoPosition2D	The current position of the vehicle.
positionCovariance†	CovariancePositionNEDType	The current error covariance value of the position data.

6.1.7   MagneticVariationSpecs

The purpose of this service is to query and report the induced magnetic deviation in the global coordinate system.

Table 20: MagneticVariationSpecs Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryMagneticVariationSpecs⊕	reportMagneticVariationSpecs

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.7.1   reportMagneticVariationSpecs

Description: This operation is used to report the induced geomagnetic deviation being used by the vehicle.

Namespace: UMAA::SA::MagneticVariationSpecs

Topic: MagneticVariationSpecsReportType

Data Type: MagneticVariationSpecsReportType

Table 21: MagneticVariationSpecsReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAAStatus		
magneticDeviation	sequence<MagneticDeviationType> max size = 360	The location specific induced magnetic variation.

6.1.8   MagneticVariationStatus

The purpose of this service is to query and report the magnetic declination in the global coordinate system.

Table 22: MagneticVariationStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryMagneticVariation⊕	reportMagneticVariation

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.8.1   reportMagneticVariation

Description: This operation is used to report the geomagnetic declination being used by the vehicle.

Namespace: UMAA::SA::MagneticVariationStatus

Topic: MagneticVariationReportType

Data Type: MagneticVariationReportType

Table 23: MagneticVariationReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAAStatus		
magneticDeclination	MagneticVariation	The difference in angle between magnetic north and true north on the horizontal plane.

6.1.9   SeaStateReport

The purpose of this service is to report the current sea state at the operational area.

Table 24: SeaStateReport Operations

Service Requests (Inputs)	Service Responses (Outputs)
querySeaState⊕	reportSeaState

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.9.1   reportSeaState

Description: This operation is used to report the current sea state from the sea state sensor on board of the vehicle.

Namespace: UMAA::SA::SeaStateReport

Topic: SeaStateReportType

Data Type: SeaStateReportType

Table 25: SeaStateReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAAStatus		
state	SeaStateEnumType	The WMO sea state.

6.1.10   SpeedStatus

This service has the responsibility of reporting the instantaneous speed of the vehicle.

Table 26: SpeedStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
querySpeed⊕	reportSpeed

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.10.1   reportSpeed

Description: This operation is used to report the speed of the vehicle.

Namespace: UMAA::SA::SpeedStatus

Topic: SpeedReportType

Data Type: SpeedReportType

Table 27: SpeedReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAAStatus		
mode†	VehicleSpeedModeEnumType	Describes the speed mode.
speedOverGround†	GroundSpeed	The velocity of the vehicle in a forward direction relative to the ground.
speedThroughAir†	IndicatedAirspeed	The velocity of the vehicle in a forward direction relative to the air current.
speedThroughWater†	SpeedLocalWaterMass	The velocity of the vehicle in a forward direction relative to the water current.

6.1.11   TranslationalShipMotionStatus

This service has the responsibility of reporting the translational motion of the vehicle.

Table 28: TranslationalShipMotionStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryTranslationalShipMotion⊕	reportTranslationalShipMotion

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.11.1   reportTranslationalShipMotion

Description: This operation is used to report the current translational motion of the vehicle.

Namespace: UMAA::SA::TranslationalShipMotionStatus

Topic: TranslationalShipMotionReportType

Data Type: TranslationalShipMotionReportType

Table 29: TranslationalShipMotionReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAAStatus		
heave†	Down	The linear vertical motion of the ship. Positive heave is down (toward the water bottom); a vehicle increasing draft is moving in the positive heave direction.
surge†	Forward	The linear longitudinal motion of the ship. Positive surge is forward of the vehicle.
sway†	Left	The linear transverse motion of the ship. Positive sway is to the port side of the vehicle.

6.1.12   VelocityStatus

The purpose of this service is to report the linear velocity and rotational rate of the vehicle. The velocity state of a rigid body is defined by six parameters that represent the velocity components of a point in the body that is coincident with the origin of the fixed reference and the instantaneous angular velocity components. The reference system is defined as a fixed coordinate system that at that instant, aligns with the vehicle or system coordinate system.

Table 30: VelocityStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryVelocity⊕	reportVelocity

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.12.1   reportVelocity

Description: This operation is used to report the current linear velocity and rotational rate of the vehicle.

Namespace: UMAA::SA::VelocityStatus

Topic: VelocityReportType

Data Type: VelocityReportType

Table 31: VelocityReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from **UMAA::UMAAStatus**		
attitudeRate	OrientationVel3D	The current rotational rate of the vehicle.
attitudeRateCovariance†	CovarianceOrientationVelocityNEDType	The current error covariance value of the attitude rate of change data.
velocity	Velocity3DPlatformNEDType	The current linear velocity (in the NED reference frame) of the vehicle.
velocityCovariance†	CovarianceVelocityNEDType	The current error covariance value of the velocity data.

6.1.13   WaterCurrentStatus

The purpose of this service is to provide information about the state of the water current.

Table 32: WaterCurrentStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryWaterCurrent⊕	reportWaterCurrent

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.13.1   reportWaterCurrent

Description: This operation is used to report the average water current near the vessel's current location.

Namespace: UMAA::SA::WaterCurrentStatus

Topic: WaterCurrentReportType

Data Type: WaterCurrentReportType

Table 33: WaterCurrentReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from **UMAA::UMAAStatus**		
currentDirection	HeadingTrueNorthAngle	The direction of the water current. The value points in the direction towards where the current is flowing.
currentSpeed	Speed	The speed of the water current.

6.1.14   WindStatus

The purpose of this service is to provide the current wind state.

Table 34: WindStatus Operations

Service Requests (Inputs)	Service Responses (Outputs)
queryWind⊕	reportWind

See Section 6.1 for an explanation of the inputs and outputs marked with a ⊕.

6.1.14.1   reportWind

Description: This operation is used to report the wind state.

Namespace: UMAA::SA::WindStatus

Topic: WindReportType

Data Type: WindReportType

Table 35: WindReportType Message Definition

Attribute Name	Attribute Type	Attribute Description
	Additional fields included from **UMAA::UMAAStatus**	
relativeAverageDirection†	RelativeAngle	The average direction from which the wind blows, measured with respect to ship's centerline. The average is taken over some time window defined by the service provider.
relativeAverageSpeed†	Speed	The average magnitude of the relative wind. The average is taken over some time window defined by the service provider.
relativeInstantaneousDirection†	RelativeAngle	The instantaneous direction from which the wind blows, measured with respect to ship's centerline.
relativeInstantaneousSpeed†	Speed	The instantaneous magnitude of the relative wind.
relativeMaximumDirection†	RelativeAngle	The maximum direction from which the wind blows, measured with respect to ship's centerline. The maximum is taken over some time window defined by the service provider. See relativeMinimumDirection for additional details.
relativeMaximumSpeed†	Speed	The maximum magnitude of the relative wind. The maximum is taken over some time window defined by the service provider.

Attribute Name	Attribute Type	Attribute Description
relativeMinimumDirection†	RelativeAngle	The minimum direction from which the wind blows, measured with respect to ship's centerline. The minimum is taken over some time window defined by the service provider. The overall direction of the wind is contained between the relativeMinimumDirection and relativeMaximumDirection direction always traveling clockwise around the circle. Therefore if the relativeMinimumDirection value is greater than the relativeMaximumDirection value, it is assumed the angle crosses 0 degrees.
relativeMinimumSpeed†	Speed	The minimum magnitude of the relative wind. The minimum is taken over some time window defined by the service provider.
straightDeckCrossSpeed†	Speed	The component of the wind normal to the ship. A negative value indicates a port crosswind and a positive value indicates a starboard crosswind.
straightDeckHeadSpeed†	Speed	The component of the wind that is parallel to the ship. A negative value indicates a tailwind and a positive value indicates a headwind.
trueAverageDirection†	AzimuthTrueNorthAngle	The average direction from which the wind blows, measured from true north. The average is taken over some time window defined by the service provider.
trueAverageSpeed†	GroundSpeed	The average magnitude of the true wind. The average is taken over some time window defined by the service provider.
trueInstantaneousDirection†	AzimuthTrueNorthAngle	The instantaneous direction from which the wind blows, measured from true north.
trueInstantaneousSpeed†	GroundSpeed	The instantaneous magnitude of the true wind.
trueMaximumDirection†	AzimuthTrueNorthAngle	The maximum direction from which the wind blows, measured from true north. The maximum is taken over some time window defined by the service provider. See trueMinimumDirection for additional details.
trueMaximumSpeed†	GroundSpeed	The maximum magnitude of the true wind. The maximum is taken over some time window defined by the service provider.
trueMinimumDirection†	AzimuthTrueNorthAngle	The minimum direction from which the wind blows, measured from true north. The minimum is taken over some time window defined by the service provider. The overall direction of the wind is contained between the trueMinimumDirection and trueMaximumDirection direction always traveling clockwise around the circle. Therefore if the trueMinimumDirection value is greater than the trueMaximumDirection value, it is assumed the angle crosses 0 degrees.
trueMinimumSpeed†	GroundSpeed	The minimum magnitude of the true wind. The minimum is taken over some time window defined by the service provider.

6.2   Common Data Types

Common data types define DDS types that are referenced throughout the UMAA model. These DDS types are considered common because they can be re-used as the data type for many attributes defined in service interface topics, interface topics, and other common data types. These data types are not intended to be directly published to/subscribed as DDS topics.

6.2.1   UCSMDEInterfaceSet

Namespace: UMAA::UCSMDEInterfaceSet

Description: Defines the common UCSMDE Interface Set Message Fields.

Table 36: UCSMDEInterfaceSet Structure Definition

Attribute Name	Attribute Type	Attribute Description
timeStamp	DateTime	The origination time of the data being conveyed in the message, or as close to the data or command generation time as is reasonably possible.

6.2.2   UMAACommand

Namespace: UMAA::UMAACommand

Description: Defines the common UMAA Command Message Fields.

Table 37: UMAACommand Structure Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UCSMDEInterfaceSet		
source*	IdentifierType	The unique identifier of the originating source of the command interface.
destination*	IdentifierType	The unique identifier of the destination of the command interface.
sessionID*	NumericGUID	The unique identifier for the session.

6.2.3   UMAAStatus

Namespace: UMAA::UMAAStatus

Description: Defines the common UMAA Status Message Fields.

Table 38: UMAAStatus Structure Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UCSMDEInterfaceSet		
source*	IdentifierType	The unique identifier of the originating source of the status interface.

6.2.4   UMAACommandStatusBase

Namespace: UMAA::UMAACommandStatusBase

Description: Defines the common UMAA Command Status Base Message Fields.

Table 39: UMAACommandStatusBase Structure Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UCSMDEInterfaceSet		
source*	IdentifierType	The unique identifier of the originating source of the command status interface.
sessionID*	NumericGUID	The unique identifier for the session.

6.2.5   UMAACommandStatus

Namespace: UMAA::UMAACommandStatus

Description: Defines the common UMAA Command Status Message Fields.

Table 40: UMAACommandStatus Structure Definition

Attribute Name	Attribute Type	Attribute Description
Additional fields included from UMAA::UMAACommandStatusBase		
commandStatus	CommandStatusEnumType	The status of the command.
commandStatusReason	CommandStatusReasonEnumType	The reason for the status of the command.
logMessage	StringLongDescription	Human-readable description related to response. Systems should not parse or use any information from this for processing purposes.

6.2.6   DateTime

Namespace: UMAA::Common::Measurement::DateTime

Description: Describes an absolute time. Conforms with POSIX time standard (IEEE Std 1003.1-2017) epoch reference point of January 1st, 1970 00:00:00 UTC.

Table 41: DateTime Structure Definition

Attribute Name	Attribute Type	Attribute Description
seconds	DateTimeSeconds	The number of seconds offset from the standard POSIX (IEEE Std 1003.1-2017) epoch reference point of January 1st, 1970 00:00:00 UTC.
nanoseconds	DateTimeNanoSeconds	The number of nanoseconds elapsed within the current DateTimeSecond.

6.2.7 ContactType

Namespace: UMAA::SA::ContactReport::ContactType

Description: This structure is used to report the contact characteristics.

Table 42: ContactType Structure Definition

Attribute Name	Attribute Type	Attribute Description
altitudeAGL†	DistanceAGL	Height above ground level of the entity.
altitudeASF†	DistanceASF	Height above the sea floor of the entity.
altitudeGeodetic†	GeodeticAltitude	Geodetic height above the ellipsoid of the entity.
altitudeMSL†	MSLAltitude	Orthometric height above the Geoid (Mean Sea Level) of the entity.
callSign†	StringShortDescription	Designator assigned by licensing authority, or name of vehicle.
confidence†	Percent	Confidence in the classification of the contact.
contactID	NumericGUID	Identifier of the entity.
contactName	StringShortDescription	Name of the contact.
course†	CourseTrueNorth	Course of the contact.
depth†	DistanceBSL	Distance below sea level of the entity.
heading†	HeadingTrueNorthAngle	Heading of the contact.
height†	Distance	Height of the contact, intended to be the largest dimension orthogonal to length in the vertical plane.
length†	Distance	Length of the contact, intended to be the longest dimension of the shape.
MMSINumber†	MMSI	Nine digit numbers used by maritime digital selective calling (DSC), automatic identification systems (AIS) and certain other equipment to uniquely identify a ship or a coast radio station.
position	GeoPosition2D	Position of the entity.
positionCovariance†	CovariancePositionNEDType	Current error covariance value of the entity position.
positionVelocityCovariance†	CovariancePositionVelocityNEDType	Current error covariance value of the entity position-velocity.
quality†	Percent	Quality of the relevant track. May represent a moving or fading average of the growth rate of the track and is useful for determining the track confidence or when to drop the track entirely.
SIDC†	StringShortDescription	Numeric code based on a hierarchical structure that provides the elements required to construct the basic symbol (defined in Appendix A of MIL-STD-2525D).
sourceContactID	sequence<NumericGUID> max size = 32	List of sources from which data was fused together to comprise this contact. If the contact was not fused from other contacts, this list is expected to be empty.
sourceIndicator	SourceIndicatorEnumType	Describes the data source indicator.
specialManeuverIndicator	SpecialManeuverIndicatorEnumType	Special maneuver indicator.

Attribute Name	Attribute Type	Attribute Description
speedOverGround	GroundSpeed	Speed over the ground of the contact.
timeFirstAcquired	DateTime	Time the contact was acquired.
timeLost†	DateTime	Time the contact was lost. For active tracks with continued detections, this value will not be provided. In the event detections are lost but the track is coasted, this value will identify the start time of coasting.
velocity†	Velocity3DPlatformNEDType	Current linear velocity of the entity.
velocityCovariance†	CovarianceVelocityNEDType	Current error covariance value of the entity velocity.
width†	Distance	Width of the contact, intended to be the largest dimension orthogonal to length in the horizontal plane.

6.2.8   CovarianceOrientationNEDType

Namespace: UMAA::Common::Measurement::CovarianceOrientationNEDType

Description: Contains variances and covariances for random variables representing estimates of Observable values. Given an Observable with true value x the estimated value $\hat{x}$ is taken to be a random variable with sample space and distribution determined by the random processes which contribute to the calculation of the sampled Observable estimation. The ObservableError for the Observable is defined to be the Mean Squared Error, $\text{MSE} = E[(\hat{x} - x)^2]$. The MSE is equal to the sum of the variance of $\hat{x}$ and the square of the estimation bias: $\text{MSE} = \text{Var}[\hat{x}] + \text{Bias}[\hat{x}]^2 = E[(\hat{x} - E[\hat{x}])^2] - E[\hat{x} - x]^2$. The variance of $\hat{x}$ is equal to the MSE, and provides an estimate of the ObservableError, if and only if the underlying estimation process is unbiased.

Table 43: CovarianceOrientationNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
rpRp	CovarOrientationNED	Pitch-Pitch orientation-orientation error covariance.
rpRy†	CovarOrientationNED	Pitch-Yaw orientation-orientation error covariance.
rrRp†	CovarOrientationNED	Roll-Pitch orientation-orientation error covariance.
rrRr	CovarOrientationNED	Roll-Roll orientation-orientation error covariance.
rrRy†	CovarOrientationNED	Roll-Yaw orientation-orientation error covariance.
ryRy	CovarOrientationNED	Yaw-Yaw orientation-orientation error covariance.

6.2.9   CovarianceOrientationVelocityNEDType

Namespace: UMAA::Common::Measurement::CovarianceOrientationVelocityNEDType

Description: Contains variances and covariances for random variables representing estimates of Observable values. Given an Observable with true value x the estimated value $\hat{x}$ is taken to be a random variable with sample space and distribution determined by the random processes which contribute to the calculation of the sampled Observable estimation. The ObservableError for the Observable is defined to be the Mean Squared Error, $\text{MSE} = E[(\hat{x} - x)^2]$. The MSE is equal to the sum of the variance of $\hat{x}$ and the square of the estimation bias: $\text{MSE} = \text{Var}[\hat{x}] + \text{Bias}[\hat{x}]^2 = E[(\hat{x} - E[\hat{x}])^2] - E[\hat{x} - x]^2$. The variance of $\hat{x}$ is equal to the MSE, and provides an estimate of the ObservableError, if and only if the underlying estimation process

is unbiased.

Table 44: CovarianceOrientationVelocityNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
rpRp	CovarOrientationVelNED	Pitch-Pitch orientation velocity-orientation velocity error covariance.
rpRy†	CovarOrientationVelNED	Pitch-Yaw orientation velocity-orientation velocity error covariance.
rrRp†	CovarOrientationVelNED	Roll-Pitch orientation velocity-orientation velocity error covariance.
rrRr	CovarOrientationVelNED	Roll-Roll orientation velocity-orientation velocity error covariance.
rrRy†	CovarOrientationVelNED	Roll-Yaw orientation velocity-orientation velocity error covariance.
ryRy	CovarOrientationVelNED	Yaw-Yaw orientation velocity-orientation velocity error covariance.

6.2.10   CovariancePositionECEFType

Namespace: UMAA::Common::Measurement::CovariancePositionECEFType

Description: Contains variances and covariances for random variables representing estimates of Observable values. Given an Observable with true value x the estimated value $\hat{x}$ is taken to be a random variable with sample space and distribution determined by the random processes which contribute to the calculation of the sampled Observable estimation. The ObservableError for the Observable is defined to be the Mean Squared Error, $\text{MSE} = E[(\hat{x} - x)^2]$. The MSE is equal to the sum of the variance of $\hat{x}$ and the square of the estimation bias: $\text{MSE} = \text{Var}[\hat{x}] + \text{Bias}[\hat{x}]^2 = E[(\hat{x} - E[\hat{x}])^2] - E[\hat{x} - x]^2$. The variance of $\hat{x}$ is equal to the MSE, and provides an estimate of the ObservableError, if and only if the underlying estimation process is unbiased.

Table 45: CovariancePositionECEFType Structure Definition

Attribute Name	Attribute Type	Attribute Description
pxPx	CovarPosECEF	X-X position-position error covariance.
pxPy†	CovarPosECEF	X-Y position-position error covariance.
pxPz†	CovarPosECEF	X-Z position-position error covariance.
pyPy	CovarPosECEF	Y-Y position-position error covariance.
pyPz†	CovarPosECEF	Y-Z position-position error covariance.
pzPz†	CovarPosECEF	Z-Z position-position error covariance.

6.2.11   CovariancePositionNEDType

Namespace: UMAA::Common::Measurement::CovariancePositionNEDType

Description: Contains variances and covariances for random variables representing estimates of Observable values. Given

an Observable with true value x the estimated value $\hat{x}$ is taken to be a random variable with sample space and distribution determined by the random processes which contribute to the calculation of the sampled Observable estimation. The ObservableError for the Observable is defined to be the Mean Squared Error, $\text{MSE} = E[(\hat{x} - x)^2]$. The MSE is equal to the sum of the variance of $\hat{x}$ and the square of the estimation bias: $\text{MSE} = \text{Var}[\hat{x}] + \text{Bias}[\hat{x}]^2 = E[(\hat{x} - E[\hat{x}])^2] - E[\hat{x} - x]^2$. The variance of $\hat{x}$ is equal to the MSE, and provides an estimate of the ObservableError, if and only if the underlying estimation process is unbiased.

Table 46: CovariancePositionNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
pdPd†	CovarPosNED	Down-Down position-position error covariance.
pePd†	CovarPosNED	East-Down position-position error covariance.
pePe	CovarPosNED	East-East position-position error covariance.
pnPd†	CovarPosNED	North-Down position-position error covariance.
pnPe†	CovarPosNED	North-East position-position error covariance.
pnPn	CovarPosNED	North-North position-position error covariance.

6.2.12   CovariancePositionVelocityNEDType

Namespace: UMAA::Common::Measurement::CovariancePositionVelocityNEDType

Description: Realizes ObservableError: an Entity that specifies a range of uncertainty for values of an Observable, usually an Observable associated with kinematics. They are used with a corresponding Observable as attributes of ResourceTypes which provide such state information. An ObservableError may be expressed as a lower and upper limit, delta values, or squares of the Observable, depending on the Frame of Reference and Coordinate Set used for the Observable. The number of values which constitutes the ObservableError is also dependent on the dimensionality of the Observable. Since Frame of Reference, Coordinates, and Dimensionality are determined in refinements specified in the Logical Data Model, the selection of attributes for specializations of this Entity are undefined in the CDM.

Table 47: CovariancePositionVelocityNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
pdVd†	CovarPosVelNED	Down-Down position-velocity error covariance.
pdVe†	CovarPosVelNED	Down-East position-velocity error covariance.
pdVn†	CovarPosVelNED	Down-North position-velocity error covariance.
peVd†	CovarPosVelNED	East-Down position-velocity error covariance.
peVe†	CovarPosVelNED	East-East position-velocity error covariance.
peVn†	CovarPosVelNED	East-North position-velocity error covariance.
pnVd†	CovarPosVelNED	North-Down position-velocity error covariance.
pnVe†	CovarPosVelNED	North-East position-velocity error covariance.
pnVn†	CovarPosVelNED	North-North position-velocity error covariance.

6.2.13   CovarianceVelocityNEDType

Namespace: UMAA::Common::Measurement::CovarianceVelocityNEDType

Description: Contains variances and covariances for random variables representing estimates of Observable values. Given an Observable with true value x the estimated value $\hat{x}$ is taken to be a random variable with sample space and distribution determined by the random processes which contribute to the calculation of the sampled Observable estimation. The ObservableError for the Observable is defined to be the Mean Squared Error, $\text{MSE} = E[(\hat{x} - x)^2]$. The MSE is equal to the sum of the variance of $\hat{x}$ and the square of the estimation bias: $\text{MSE} = \text{Var}[\hat{x}] + \text{Bias}[\hat{x}]^2 = E[(\hat{x} - E[\hat{x}])^2] - E[\hat{x} - x]^2$. The variance of $\hat{x}$ is equal to the MSE, and provides an estimate of the ObservableError, if and only if the underlying estimation process is unbiased.

Table 48: CovarianceVelocityNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
vdVd†	CovarVelNED	Down-Down velocity-velocity error covariance.
veVd†	CovarVelNED	East-Down velocity-velocity error covariance.
veVe	CovarVelNED	East-East velocity-velocity error covariance.
vnVd†	CovarVelNED	North-Down velocity-velocity error covariance.
vnVe†	CovarVelNED	North-East velocity-velocity error covariance.
vnVn	CovarVelNED	North-North velocity-velocity error covariance.

6.2.14   GeoPosition2D

Namespace: UMAA::Common::Measurement::GeoPosition2D

Description: Specifies a location on the surface of the Earth.

Table 49: GeoPosition2D Structure Definition

Attribute Name	Attribute Type	Attribute Description
geodeticLatitude	GeodeticLatitude	Specifies the north-south coordinate of the position.
geodeticLongitude	GeodeticLongitude	Specifies the east-west coordinate of the position.

6.2.15   IdentifierType

Namespace: UMAA::Common::IdentifierType

Description: This structure defines a two-level hierarchical identifier, where the parent is defined to be a group or collection of entities.

Table 50: IdentifierType Structure Definition

Attribute Name	Attribute Type	Attribute Description
id	NumericGUID	Provides the identifier of an entity.
parentID	NumericGUID	Provides the identifer of the parent, which is a group or collection of one or more entities. If the entity has no parent (it is the root of the tree), this value will be the Nil UUID.

6.2.16   MagneticDeviationType

Namespace: UMAA::Common::Orientation::MagneticDeviationType

Description: This structure is used to describe the induced magnetic deviation at a specific heading for the vehicle.

Table 51: MagneticDeviationType Structure Definition

Attribute Name	Attribute Type	Attribute Description
heading	HeadingTrueNorthAngle	The vehicle heading with respect to true north.
magneticDeviation	MagneticVariation	The difference in angle between measured magnetic north and actual magnetic north on the horizontal plane as a result of the vehicle's material properties.

6.2.17   Orientation3DNEDType

Namespace: UMAA::Common::Orientation::Orientation3DNEDType

Description: A requirement that specifies an orientation relative to a North-East-Down coordinate system centered on the platform.

Table 52: Orientation3DNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
pitch	PitchYNEDType	Defines a pitch relative to a North-East-Down coordinate system centered on the platform.
roll	RollXNEDType	Defines a roll relative to a North-East-Down coordinate system centered on the platform.
yaw	YawZNEDType	Defines a yaw relative to a North-East-Down coordinate system centered on the platform.

6.2.18 OrientationVel3D

Namespace: UMAA::Common::Measurement::OrientationVel3D

Description: Specifies the rate of change for each axis of an Orientation.

Table 53: OrientationVel3D Structure Definition

Attribute Name	Attribute Type	Attribute Description
pitchRate	PitchRate	Specifies the rate of change of the platform's pitch angle.
rollRate	RollRate	Specifies the rate of change of the platform's roll angle.
yawRate	YawRate	Specifies the rate of change of the platform's yaw angle.

6.2.19 PitchYNEDType

Namespace: UMAA::Common::Orientation::PitchYNEDType

Description: Specifies a pitch relative to the NED coordinate system.

Table 54: PitchYNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
pitch	PitchHalfAngle	Defines a pitch relative to the NED coordinate system.

6.2.20 RollXNEDType

Namespace: UMAA::Common::Orientation::RollXNEDType

Description: Specifies a roll relative to the NED coordinate system.

Table 55: RollXNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
roll	RollAngle	Defines a roll relative to the NED coordinate system.

6.2.21 Velocity3DPlatformNEDType

Namespace: UMAA::Common::Measurement::Velocity3DPlatformNEDType

Description: Specifies the velocity of the platform with vector components expressed in a North-East-Down coordinate system centered on the platform.

Table 56: Velocity3DPlatformNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
downSpeed	DownSpeed	Specifies the down velocity vector in a North-East-Down coordinate system centered on the platform.
eastSpeed	EastSpeed	Specifies the easting velocity vector in a North-East-Down coordinate system centered on the platform.
northSpeed	NorthSpeed	Specifies the northing velocity vector in a North-East-Down coordinate system centered on the platform.

6.2.22   YawZNEDType

Namespace: UMAA::Common::Orientation::YawZNEDType

Description: Specifies a yaw relative to the NED coordinate system.

Table 57: YawZNEDType Structure Definition

Attribute Name	Attribute Type	Attribute Description
yaw	YawAngle	Defines a yaw relative to the NED coordinate system.

6.3   Enumerations

Enumerations are used extensively throughout UMAA. This section lists the values associated with each enumeration defined in UCS-UMAA.

6.3.1   COLREGSClassificationEnumType

Namespace: UMAA::Common::MaritimeEnumeration::COLREGSClassificationEnumType

Description: This enumeration is designed to classify a vehicle with accordance to COLREGS definitions.

Table 58: COLREGSClassificationEnumType Enumeration

Enumeration Value	Description
ANCHORED	The vehicle is currently anchored.
CONSTRAINED_BY_DRAUGHT	The vehicle is limited in its navigational capabilities by its draught.
FISHING	The vehicle is fishing with nets, lines, trawls, or other fishing apparatus which restrict maneuverability. This does not include a vehicle fishing with trolling lines or other fishing apparatus which do not restrict maneuverability.
NON_VESSEL	Contact is determined to not be a vehicle (buoy, land, etc.). COLREGS does not apply.
NOT_UNDER_COMMAND	The vehicle, through some exceptional circumstance, is unable to maneuver as required by these rules and is therefore unable to keep out of the way of another vehicle.
POWER_DRIVEN_UNDERWAY	The vehicle is propelled by machinery.
PUSHING	The vehicle is engaged in a pushing operation such as severely restricts the pushing vehicle and her push in their ability to deviate from their course.
RESTRICTED_IN_ABILITY_TO_-MANUEVER	The vehicle is restricted in her ability to maneuver means a vehicle which, from the nature of her work, is restricted in her ability to maneuver as required by these rules and is therefore unable to keep out of the way of another vehicle.
SAILING	The vehicle is under sail and propelling machinery, if fitted, is not being used.
TOWING	The vehicle is engaged in a towing operation that severely restricts the towing vehicle and her tow in their ability to deviate from their course.

6.3.2   CommandStatusReasonEnumType

Namespace: UMAA::Common::MaritimeEnumeration::CommandStatusReasonEnumType

Description: Defines a mutually exclusive set of reasons why a command status state transition has occurred.

Table 59: CommandStatusReasonEnumType Enumeration

Enumeration Value	Description
CANCELED	Indicates a transition to the CANCELED state when the command is canceled successfully.
INTERRUPTED	Indicates a transition to the FAILED state when the command has been interrupted by a higher priority process.
OBJECTIVE_FAILED	Indicates a transition to the FAILED state when the commanded resource is unable to achieve the command's objective due to external factors.

Enumeration Value	Description
RESOURCE_FAILED	Indicates a transition to the FAILED state when the commanded resource is unable to achieve the command's objective due to resource or platform failure.
RESOURCE_REJECTED	Indicates a transition to the FAILED state when the commanded resource rejects the command for some reason.
SERVICE_FAILED	Indicates a transition to the FAILED state when the commanded resource is unable to achieve the command's objective due to processing failure.
SUCCEEDED	Indicates the conditions to proceed to this state have been met and a normal state transition has occurred.
TIMEOUT	Indicates a transition to the FAILED state when the command is not acknowledged within some defined time bound.
UPDATED	Indicates a transition back to the ISSUED state from a non-terminal state when the command has been updated.
VALIDATION_FAILED	Indicates a transition to the FAILED state when the command contains missing, out-of-bounds, or otherwise invalid parameters.

6.3.3 CommandStatusEnumType

Namespace: UMAA::Common::MaritimeEnumeration::CommandStatusEnumType

Description: Defines a mutually exclusive set of values that defines the states of a command as it progresses towards completion.

Table 60: CommandStatusEnumType Enumeration

Enumeration Value	Description
CANCELED	The command was canceled by the requestor before the command completed successfully.
COMMANDED	The command has been placed in the resource's command queue but has not yet been accepted.
COMPLETED	The command has been completed successfully.
EXECUTING	The command is being performed by the resource and has not yet been completed.
FAILED	The command has been attempted, but was not successful.
ISSUED	The command has been issued to the resource (typically a sensor or streaming device), but processing has not yet commenced.

6.3.4 NavigationSolutionEnumType

Namespace: UMAA::Common::MaritimeEnumeration::NavigationSolutionEnumType

Description: A mutually exclusive set of values that defines the navigation solution.

Table 61: NavigationSolutionEnumType Enumeration

Enumeration Value	Description
ESTIMATED	Interpolated, projected, and/or produced through computation.
GROUND_TRUTH	Navigation solution from an external source that is considered to be correct.
MEASURED	Provided by a sensing system.

6.3.5   SeaStateEnumType

Namespace: UMAA::Common::OrderedEnumeration::SeaStateEnumType

Description: A mutually exclusive set of values that defines sea state conditions according to the World Meteorological Organization (WMO).

Table 62: SeaStateEnumType Enumeration

Enumeration Value	Description
CALM_GLOSSY	The sea state is calm glossy, which is characterized by wave height of 0 meters and a World Meteorological Organization (WMO) sea state code of 0.
CALM_RIPPLED	The sea state is calm rippled, which is characterized by wave heights of 0 to 0.1 meters and a World Meteorological Organization (WMO) sea state code of 1.
HIGH	The sea state is high, which is characterized by wave heights of 6 to 9 meters and a World Meteorological Organization (WMO) sea state code of 7.
MODERATE	The sea state is moderate, which is characterized by wave heights of 1.25 to 2.5 meters and a World Meteorological Organization (WMO) sea state code of 4.
PHENOMENAL	The sea state is phenomenal, which is characterized by wave heights of over 14 meters and a World Meteorological Organization (WMO) sea state code of 9.
ROUGH	The sea state is rough, which is characterized by wave heights of 2.5 to 4 meters and a World Meteorological Organization (WMO) sea state code of 5.
SLIGHT	The sea state is slight, which is characterized by wave heights of 0.5 to 1.25 meters and a World Meteorological Organization (WMO) sea state code of 3.
SMOOTH	The sea state is smooth, which is characterized by wave heights of 0.1 to 0.5 meters and a World Meteorological Organization (WMO) sea state code of 2.
VERY_HIGH	The sea state is very high, which is characterized by wave heights of 9 to 14 meters and a World Meteorological Organization (WMO) sea state code of 8.
VERY_ROUGH	The sea state is very rough, which is characterized by wave heights of 4 to 6 meters and a World Meteorological Organization (WMO) sea state code of 6.

6.3.6   SourceIndicatorEnumType

Namespace: UMAA::Common::MaritimeEnumeration::SourceIndicatorEnumType

Description: Defines a mutually exclusive set of values for the data source.

Table 63: SourceIndicatorEnumType Enumeration

Enumeration Value	Description
ACTUAL	Source of data is actual sensor data.
GROUND_TRUTH	Source of data is ground truth.
SIMULATED	Source of data is simulated sensor data.
TENTATIVE	Source of data is tentative sensor data.

6.3.7   SpecialManeuverIndicatorEnumType

Namespace: UMAA::Common::MaritimeEnumeration::SpecialManeuverIndicatorEnumType

Description: A mutually exclusive set of values that defines the special maneuver indicator.

Table 64: SpecialManeuverIndicatorEnumType Enumeration

Enumeration Value	Description
ENGAGED	The vessel is engaged in a special maneuver.
NOT_AVAILABLE	The contact source is explicitly reporting that the special maneuver indicator is not available.
NOT_ENGAGED	The vessel is not engaged in a special maneuver.
NOT_PROVIDED	The contact source is not able to determine this information.

6.3.8   VehicleSpeedModeEnumType

Namespace: UMAA::Common::MaritimeEnumeration::VehicleSpeedModeEnumType

Description: A mutually exclusive set of values that defines the type of performance speed of the vehicle.

Table 65: VehicleSpeedModeEnumType Enumeration

Enumeration Value	Description
LRC	Long Range Cruise. A speed that optimizes time, distance and fuel consumption for a vehicle (definition of "optimized" is subjective. Example: for a planing hull, this is usually the minimum planing speed, even though lower speeds can achieve longer endurance or range.)
MEC	Maximum Endurance Cruise. The speed that maximizes the time a vehicle can travel.
MRC	Maximum Range Cruise. The speed that maximizes the distance a vehicle can travel.
SLOW	Slow speed. Minimum speed at which the vehicle can operate (definition of "operate" is subjective. Example: minimum speed to achieve maneuverability, engine idle speed/gear clutched in "idle ahead", etc.)
VEHICLE_SPECIFIC	Preset speed for the vehicle, that is in the range of speeds for the subject vehicle

6.3.9   VisualClassificationEnumType

Namespace: UMAA::Common::MaritimeEnumeration::VisualClassificationEnumType

Description: Defines a mutually exclusive set of values that defines the visual classification.

Table 66: VisualClassificationEnumType Enumeration

Enumeration Value	Description
AID_TO_NAVIGATION_CHANNEL_MARKER	Channel marker used as an aid to navigation.
AID_TO_NAVIGATION_GENERAL	General aid to navigation.
AID_TO_NAVIGATION_LARGE_-BUOY	Large buoy used as an aid to navigation.
AID_TO_NAVIGATION_LIGHTHOUSE	Lighthouse used as an aid to navigation.
AID_TO_NAVIGATION_SMALL_-BUOY	Small buoy used as an aid to navigation.
LARGE_GENERAL_OBSTACLE	Large general obstacle.
LARGE_VESSEL_CARGO	Large cargo vehicle.
LARGE_VESSEL_GENERAL	Large general vehicle.
LARGE_VESSEL_MILITARY	Large military vehicle.
LARGE_VESSEL_OTHER	Large vehicle that does not fit into other LARGE_VESSEL categories.
LARGE_VESSEL_PASSENGER	Large passenger vehicle.
MEDIUM_VESSEL_FISHING	Fishing vehicle.
MEDIUM_VESSEL_GENERAL	Medium general vehicle.
MEDIUM_VESSEL_MILITARY	Medium military vehicle.
MEDIUM_VESSEL_OTHER	Medium vehicle that does not fit into other MEDIUM_VESSEL categories.
MEDIUM_VESSEL_TUG	Tug vehicle.
MEDIUM_VESSEL_TUG_IN_TOW	Tug vehicle towing another vehicle.
MEDIUM_VESSEL_YACHT	Yacht.
SAILBOAT	Sailboat.
SMALL_GENERAL_OBSTACLE	Small general obstacle.
SMALL_VESSEL_GENERAL	Small general vehicle.
SMALL_VESSEL_JET_SKI	Jet ski.
SMALL_VESSEL_MILITARY	Small military vehicle.
SMALL_VESSEL_OTHER	Small vehicle that does not fit into other SMALL_VESSEL categories.
SMALL_VESSEL_POWER_BOAT	Power boat.

6.4 Type Definitions

This section describes the type definitions for UMAA. The table below lists how UMAA defined types are mapped to the DDS primitive types.

Table 67: Type Definitions

Type Name	Primitive Type	Range of Values	Description
AzimuthTrueNorthAngle	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=TrueNorth	Specifies the horizontal angular vector from an observer to an entity, relative to true north.
CourseTrueNorth	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=TrueNorth	Specifies the direction of the platform's motion relative to true north.
CovarOrientationNED	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=NED units=RadiansSquared	Describes a measure of linear dependence that indicates orientation-orientation covariance in the NED coordinate system.
CovarOrientationVelNED	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=NED units=RadiansSquaredPerSecondSquared	Describes a measure of linear dependence that indicates orientation velocity-orientation velocity covariance in the NED coordinate system.
CovarPosECEF	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=ECEF units=MetersSquared	Describes a measure of linear dependence that indicates position-position covariance in the earth-centered, earth-fixed reference frame.
CovarPosNED	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=NED units=MetersSquared	Describes a measure of linear dependence that indicates position-position covariance in the NED coordinate system.
CovarPosVelNED	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=NED units=MetersSquaredPerSecond	Describes a measure of linear dependence that indicates position-velocity covariance in the NED coordinate system.
CovarVelNED	double	maxInclusive=10000 minInclusive=-10000 referenceFrame=NED units=MetersSquaredPerSecondSquared	Describes a measure of linear dependence that indicates velocity-velocity covariance in the NED coordinate system.
DateTimeNanoseconds	long	units=Nanoseconds minInclusive=0 maxInclusive=999999999	The number of nanoseconds elapsed within the current second.
DateTimeSeconds	longlong	units=Seconds minInclusive=-9223372036854775807 maxInclusive=9223372036854775807	The seconds offset from the standard POSIX (IEEE Std 1003.1-2017) epoch reference point of January 1st, 1970 00:00:00 UTC.

Type Name	Primitive Type	Range of Values	Description
Distance	double	maxInclusive=401056000 minInclusive=0 units=Meter referenceFrame=Counting	This type stores a distance in meters.
DistanceAGL	double	minInclusive=0.0 units=Meter referenceFrame=AGL	Describes the height above ground level of the vehicle.
DistanceASF	double	maxInclusive=401056000 minInclusive=0 units=Meter referenceFrame=ASF	The altitude or distance above the sea floor in meters.
DistanceBSL	double	maxInclusive=10000 minInclusive=0 units=Meter referenceFrame=BSL	The distance below sea level in meters.
Down	double	axisAbbrev=Z axisDirection=down axisUnit=Meter maximumValue=50000 minimumValue=-50000 rangeMeaning=exact resolution=0.001	Used for measuring position and increases in magnitude as values extend toward the center of the Earth. Down measurements are expressed in meters.
DownSpeed	double	axisDirection=down axisUnit=MeterPerSecond maximumValue=299792458 minimumValue=-299792458 rangeMeaning=exact resolution=0.001 units=MeterPerSecond	Used for measuring speed and increases in magnitude as speed toward the center of the Earth increases.
EastSpeed	double	axisDirection=east axisUnit=MeterPerSecond maximumValue=299792458 minimumValue=-299792458 rangeMeaning=exact resolution=0.001 units=MeterPerSecond	Used for measuring speed and increases in magnitude as speed in the easterly direction increases.
Forward	double	axisAbbrev=X axisDirection=fore axisUnit=Meter maximumValue=20000000 minimumValue=-20000000 rangeMeaning=exact resolution=0.001	Used for measuring position and increases in magnitude as position extends out the "front" of the reference body. Forward measurements are expressed in meters.
GeodeticAltitude	double	maxInclusive=700000 minInclusive=-10000 units=Meter axisAbbrev=Altitude axisDirection=up axisUnit=Meter rangeMeaning=exact resolution=0.0000000001	Used for measuring position and increases in magnitude as position extends upward. Altitude measurements are expressed in meters.

Type Name	Primitive Type	Range of Values	Description
GeodeticLatitude	double	axisAbbrev=Latitude axisDirection=north/south axisUnit=Degrees maximumValue=90.0 minimumValue=-90.0 rangeMeaning=exact resolution=0.0000000001	Used for measuring position and increases in magnitude as position extends from the south pole to the north pole. Latitude measurements are expressed in degrees.
GeodeticLongitude	double	axisAbbrev=Longitude axisDirection=east axisUnit=Degrees maximumValue=180.0 minimumValue=-180.0 rangeMeaning=wraparound resolution=0.0000000001	Used for measuring position and increases in magnitude as position extends eastward. Longitude measurements are expressed in degrees. Longitude measurements are periodic and whose limits (min and max), while mathematically discontinuous, represent a continuous range.
GroundSpeed	double	maxInclusive=299792458 minInclusive=-299792458 units=MeterPerSecond referenceFrame=Ground	The magnitude of the horizontal velocity vector of a vehicle relative to the ground.
HeadingTrueNorthAngle	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=TrueNorth	Describes heading with respect to True North.
IndicatedAirspeed	double	maxInclusive=299792458 minInclusive=0 units=MeterPerSecond referenceFrame=LocalAirMass	This type specifies the magnitude of an aircraft's velocity (the rate of change of its position). Indicated airspeed (IAS) is the airspeed read directly from the airspeed indicator on an aircraft, driven by the pitot-static system.
LargeCollectionSize	long	maxInclusive=2147483647 minInclusive=0	Specifies the size of a Large Collection.
Left	double	maxInclusive=20000000 minInclusive=-20000000 units=Meter axisAbbrev=Y axisDirection=port axisUnit=Meter rangeMeaning=exact resolution=0.001	Used for measuring position and increases in magnitude as position extends out the "left" of the reference body. Left measurements are expressed in meters.
MagneticVariation	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=TrueNorth	Specifies the angle on the horizontal plane between true north and magnetic north (the direction the north end of the compass needle points).
MMSI	string	length=9	Maritime Mobile Service Identity, a series of nine digits which uniquely identifies a station.
MSLAltitude	double	minInclusive=0.0 units=Meter referenceFrame=Altitude	Describes the current orthometric height above the Geoid (Mean Sea Level).

Type Name	Primitive Type	Range of Values	Description
NorthSpeed	double	axisDirection=north axisUnit=MeterPerSecond maximumValue=299792458 minimumValue=-299792458 rangeMeaning=exact resolution=0.001 units=MeterPerSecond	Used for measuring speed and increases in magnitude as speed in the northerly direction increases.
NumericGUID	octet[16]	minInclusive=0 maxInclusive=(2^128)-1	Represents a 128-bit number according to RFC 4122 variant 2.
Percent	double	maxInclusive=1000 minInclusive=0 units=Percent referenceFrame=Counting	Defines a percentage where 100% = 100.0. Values greater than 100% are allowed.
PitchHalfAngle	double	maxInclusive=1.5707963267948966 minInclusive=-1.5707963267948966 units=Radian referenceFrame=PlatformNED	Specifies the platform's rotation about the lateral axis (e.g. the axis parallel to the wings) in a locally level, North-East-Down coordinate system centered on the platform. Pitch is zero when the platform is "nose to tail level" in the North-East plane. The measurement is stated in radians between -0.5 pi and 0.5 pi.
PitchRate	double	maxInclusive=32.767 minInclusive=-32.767 units=RadianPerSecond referenceFrame=Counting	Specifies the rate of change of the platform's pitch angle.
RelativeAngle	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=Counting	Specifies the angle between two intersecting rays.
RollAngle	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 units=Radian referenceFrame=PlatformNED	Specifies a platform's rotation about the longitudinal axis (e.g. the axis through the body of the vehicle from tail to nose) in a locally level, North-East-Down coordinate system centered on the vehicle. Roll is zero when the platform is "wing-tip to wing-tip" level in the North-East plane.
RollRate	double	maxInclusive=32.767 minInclusive=-32.767 units=RadianPerSecond referenceFrame=Counting	Specifies the rate of change of the platform's roll angle.
Speed	double	maxInclusive=299792458 minInclusive=0 units=MeterPerSecond referenceFrame=Counting	This type stores speed in meters/s.
SpeedLocalWaterMass	double	maxInclusive=299792458 minInclusive=0 units=MeterPerSecond referenceFrame=LocalWaterMass	This type stores speed in meters/s.

Type Name	Primitive Type	Range of Values	Description
StringLongDescription	string	length=4095	Represents a long format description.
StringShortDescription	string	length=1023	Represents a short format description.
YawAngle	double	maxInclusive=6.28318530718 minInclusive=-6.28318530718 referenceFrame=PlatformNED units=Radian	The yaw angle relative to the NED coordinate system centered at the platform location.
YawRate	double	maxInclusive=32.767 minInclusive=-32.767 units=RadianPerSecond referenceFrame=Counting	Specifies the rate of change of the platform's yaw angle.

A   Appendices

A.1   Glossary

Note: This glossary aims to define terms that are uncommon, or have a special meaning in the context of UMAA and/or the DoD. This glossary covers the complete UMAA specification. Not every word defined here appears in every ICD.

Almanac Data (GPS)	A navigation message that contains information about the time and status of the entire satellite constellation.
Coulomb	The SI unit of electric charge, equal to the quantity of electricity conveyed in one second by a current of one ampere.
Ephemeris Data (GPS)	A navigation message used to calculate the position of each satellite in orbit.
Glowplug or Glow Plug	A heating device used to aid in starting diesel engines.
Interoperability	1) The ability to act together coherently, effectively, and efficiently to achieve tactical, operational, and strategic objectives. 2) The condition achieved among communications-electronics systems or items of communications-electronics equipment when information or services can be exchanged directly and satisfactorily between them and/or their users.
Mean Sea Level	The average height of the surface of the sea for all stages of the tide; used as a reference for elevations.
Middleware	A type of computer software that provides services to software applications beyond those available from the operating system. Middleware makes it easier for software developers to implement communication and input/output, so they can focus on the specific purpose of their application.
SoaML	The Service oriented architecture Modeling Language (SoaML) specification that provides a metamodel and a UML profile for the specification and design of services within a service-oriented architecture. The specification is managed by the Object Management Group (OMG).

A.2   Acronyms

Note: This acronym list is included in every ICD and covers the complete UMAA specification. Not every acronym appears in every ICD.

ADD	Architecture Design Description
AGL	Above Sea Level
ASF	Above Sea Floor
BSL	Below Sea Level
BWL	Beam at Waterline
C2	Command and Control
CMD	Command
CO	Comms Operations
CPA	Closest Point of Approach
CTD	Conductivity, Temperature and Depth
DDS	Data Distribution Service
DTED	Digital Terrain Elevation Data
EGM	Earth Gravity Model
EO	Engineering Operations
FB	Feedback
GUID	Globally Unique Identifier
HM&E	Hull, Mechanical, & Electrical

ICD	Interface Control Document
ID	Identifier
IDL	Interface Definition Language Specification
IMO	International Maritime Organization
INU	Inertial Navigation Unit
LDM	Logical Data Model
LOA	Length Over All
LRC	Long Range Cruise
LWL	Length at Waterline
MDE	Maritime Domain Extensions
MEC	Maximum Endurance Cruise
MM	Mission Management
MMSI	Maritime Mobile Service Identity
MO	Maneuver Operations
MRC	Maximum Range Cruise
MSL	Mean Sea Level
OMG	Object Management Group
PIM	Platform Independent Model
PMC	Primary Mission Control
PNT	Precision Navigation and Timing
PO	Processing Operations
PSM	Platform Specific Model
RMS	Root-Mean-Square
ROC	Risk of Collision
RPM	Revolutions per minute
RTPS	Real Time Publish Subscribe
RTSP	Real Time Streaming Protocol
SA	Situational Awareness
SEM	Sensor and Effector Management
SO	Support Operations
SoaML	Service-oriented architecture Modeling Language
STP	Standard Temperature and Pressure
UCS	Unmanned Systems Control Segment
UMAA	Unmanned Maritime Autonomy Architecture
UML	Unified Modeling Language
UMS	Unmanned Maritime System
UMV	Unmanned Maritime Vehicle
UxS	Unmanned System
WGS84	Global Coordinate System
WMM	World Magnetic Model
WMO	World Meteorological Organization
